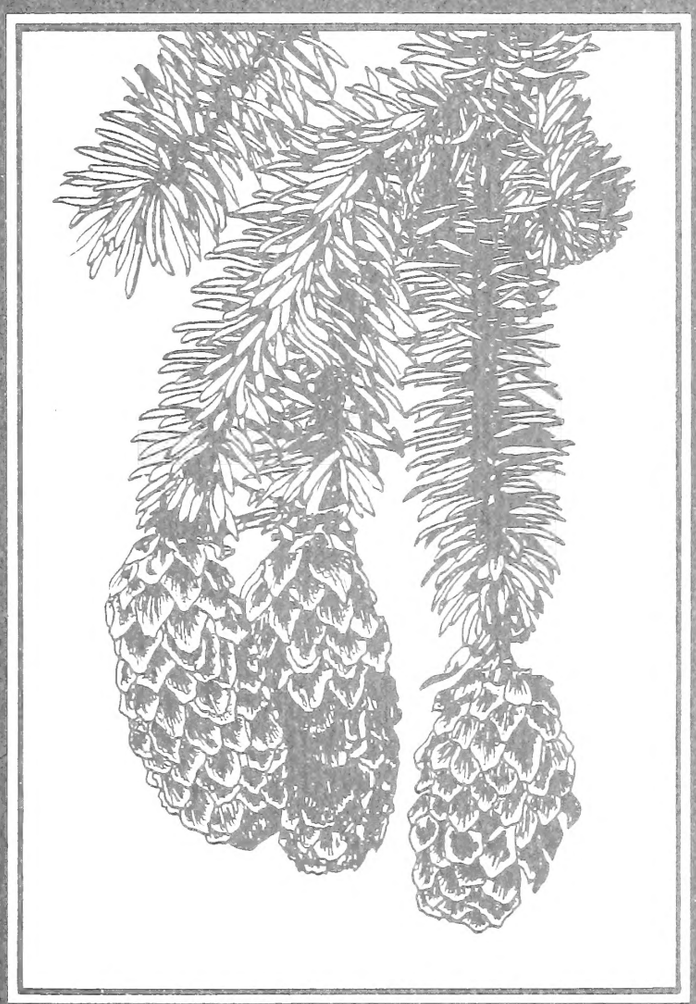
USDA FOREST SERVICE RESEARCH PAPER PNW-105

SITKA SPRUCE -- a bibliography with abstracts



PACIFIC NORTHWEST FOREST AND RANGE EXPERIMENT STATION
FOREST SERVICE, U.S. DEPARTMENT OF AGRICULTURE

1970
PORTLAND, OREGON

FOREWORD

This bibliography contains references to world literature on Sitka spruce (*Picea sitchensis* (Bong.) Carr.) published through 1967. A subject matter index appears on pages 234-249, and a list of scientific and common names of tree and plant species mentioned is on pages 250-251. References are listed alphabetically by author.[1/]

Abstracts are given for many references. A large number are author abstracts used verbatim or condensed to include a minimum of essential detail. New abstracts were written where appropriate, often excerpting references to Sitka spruce from works dealing with more general subjects. Many abstracts were adapted or taken directly from "Forestry Abstracts," and special thanks are extended to Christopher Swabey, Director, Commonwealth Agricultural Bureaux Organisation, Oxford, for permission to reproduce this material. In compiling the bibliography, the most useful sources of references were "Forestry Abstracts" and "Bibliography of Agriculture," not only in locating references but also in providing title translations of foreign literature. Special effort was made to include the large body of British literature resulting from extensive plantings of Sitka spruce in the British Isles--an important source of information sometimes overlooked by American foresters.

Sincere appreciation is extended to reviewers who pointed out references not found by the compilers, and to the many librarians and others who provided reference material and helped in the preparation of this bibliography.

We would appreciate learning of additional articles on Sitka spruce not included here.

[1/] Publications listed herein are not available from the Pacific Northwest Forest and Range Experiment Station unless issued by the organization. Requests for reprints should be addressed to the author cited.

BIBLIOGRAPHY

1. Anonymous.
1903. Lumbering in Alaska. Columbia River and Oregon. Timberman 4(3): 39.

2. _____
1909. Alaska's timber resources. Lumber Rev. 19(23): 18.

3. _____
1915. Logging in Alaska. Timberman 16(4): 48, illus.

Describes logging of Sitka spruce (referred to as Menzies spruce) in Alaska.

4. _____
1928. Seed soaked in sea water remain good. Forest Worker, Nov., p. 8.

5. _____
1932. Pacific coast spruce-hemlock area preserved. J. Forest. 30: 1020.

A tract of 1,400 acres in the Sitka spruce-western hemlock type has been set aside as the Quinault Natural Area. The tract contains some of the finest specimens of Sitka spruce to be found in the few remaining stands of old-growth timber.

6. _____
1942. Alaskan spruce for national defense. Amer. Forest. 48: 354-355, illus.

7. _____
1944. Popular misconceptions refuted in kiln-drying tests on Sitka spruce at Vancouver laboratories. Brit. Columbia Lumberman 28(12): 72-73.

Describes the effect of various kiln schedules on strength properties of Sitka spruce. With proper schedules, kiln-drying does not impair strength.

8. _____
1955. Canadian seeds used in Welsh forests. Brit. Columbia Lumberman 39(9): 34, illus.

Twice as many Sitka spruce trees are planted in Wales as any other species. The spruce grows well on the highlands, being hardy and resistant to exposure.

9. _____
1957. Alaska's logging operations pose unusual conditions. Timberman 58(12): 98.

10. _____
1957. Massenauftreten der Sitkalaus. [Mass outbreak of *Neomyzaphis abietina*.] Holz-Zentralbl. 83(70/71): 903-904. [In German.]

11. _____
1959. Canadian building timbers. Wood 24(8): 322-325, illus.

12. _____
1962. Sitka spruce named Alaska State tree. J. Forest. 60: 370.

On February 28, 1962, the Governor of Alaska signed a bill designating Sitka spruce as Alaska's official State tree.

13. _____
1962. B. C. Sitka spruce excels in Coventry Church. Brit. Columbia Lumberman 46(7): 76-77, illus.

Sitka spruce was used for the decorative inner canopy of the roof of the nave. In Great Britain, B.C. Sitka spruce has been widely used in aircraft and boatbuilding, and for highly stressed components in ladders, agricultural machinery, and vehicle bodies. For its resonance it finds favor with the makers of pianos and stringed instruments of all kinds.

14. _____
1964. Liability of trees on peat to wind-throw. Scot. Forest. 18(1): 38-43.

15. _____
1965. Alaska timber sales: Tongass National Forest sale volume 8.7 billion board feet. Forest Ind. 92(10): 64-65, illus.

A sale of 8,750 million board feet of timber was offered by the USDA Forest Service. The stand is estimated to contain about 44 percent western hemlock and 56 percent Sitka spruce, with small amounts of other species.

16. _____
1967. Target: 75 million seedlings by 1975. Brit. Columbia Lumberman 51(10): 40, illus.

The Forest Service officially opened a major forest nursery at Koksilah which will concentrate on growing Sitka spruce and western hemlock and will be capable of producing 7 million seedlings each year.

17. Aaron, J. R.
1957. Conifer barks as a source of tannins for the leather industry. Scot. Forest. 11(2): 72-76.

Analysis of 31 samples of Sitka spruce bark from trees grown in Great Britain showed an average tannin content of 17.5 percent. Percentage yield from dominant trees was higher than from suppressed trees. Yield was higher when bark was handpeeled than when bark was removed mechanically or chemically.

18. _____
1963. An interim report on field trials of treated and untreated round fencing timber. *In* Report on forest research for the year ended March 1962. Great Brit. Forest. Comm., pp. 133-137. London: H. M. Stationery Office.

19. Abdurahman, N., Dutton, G. G. S., McLardy, D. M., and others.
1964. Hemicelluloses of black spruce, Sitka spruce, ponderosa pine, and Douglas-fir. Tappi 47: 812.

Chlorite holocelluloses of each of the four woods were extracted with alkali and the hemicelluloses separated into fractions rich in "xylan," "galactoglucomannan," and "glucomannan." The characteristics of the extracts made from the different woods are compared.

20. Abell, J.
1954. Lokale Douglasovervejelser. [Douglas-fir in Denmark.] Dansk Skovforen. Tidsskr. 39(1): 1-60. [In Danish.]

21. Abrams, Leroy.
1940. An illustrated flora of the Pacific States, Washington, Oregon, and California. Vol. 1, ed. 2, 538 pp., illus. Stanford: Stanford Univ. Press.

22. Ackers, C. P.
1947. Practical British forestry. Ed. 2, 394 pp., illus. London: Oxford Univ. Press.

Describes briefly the silviculture of Sitka spruce in Britain.

23. Adams, Bristow.
1903. The Unalaska spruce plantation. Forest. & Irrig. 9: 382-385, illus.

Describes Sitka spruce planted in the Aleutian Islands in 1805 by the Russians and discusses the natural treelessness of the Aleutians.

24. Addison, John W.
1966. Nutrient experiments with Sitka spruce. 76 pp., illus. (B.S. in Forestry thesis on file at Univ. Brit. Columbia, Vancouver.)

25. Ahrens, Von E.
1964. Untersuchungen über den Gehalt von Blättern und Nadeln verschiedener Baumarten an Kupfer, Zink, Bor, Molydbän und Mangan. [The content of Cu, Zn, B, Mo, and Mn in foliage of various tree species.] Allg. Forst- und Jagdzeit. 135(1): 8-16. [In German. English summary.]

Analyses of chemical elements in the foliage of several tree species, including Sitka spruce, as related to site, season, and other factors.

26. Ainslie, J. R.
1941. Timbers used in the construction of aeroplanes. Wood 6: 60-63, illus.

The species most commonly used in aircraft construction are ash and Sitka spruce. The material characteristics required for each part of the plane are discussed; the timbers now in use are given, and others that should be suitable are suggested.

27. Alaska University.
1967. The Kodiak economic community. Alaska, review of business and economic conditions. Univ. Alaska Inst. Soc., Econ., Government Res. 8 pp., illus.

Afognak Island, the smaller islands around it, and the northeast tip of Kodiak Island have valuable stands of Sitka spruce. Tree quality is lower than in southeast Alaska, and the stands are very heavily stocked. There are 270,000 acres of commercial forest land on the Archipelago. Plans and possibilities for commercial development are described.

28. Aldhous, J. R.
1959. Control of cutworm in forest nurseries. Forestry 32(2): 155-165.

Experiments were made to investigate the effect of BHC, DDT, aldrin, and dieldrin on cutworms (*Agrotis segetum*) and the phytotoxicity of these chemicals to Sitka spruce seedlings. A spray containing 3 pounds aldrin per acre (as a 30-percent miscible oil) or 1½ pounds dieldrin per acre (as a 15-percent miscible oil) gave excellent control of *A. segetum* larvae and did no damage to the seedling crop. Both insecticides were applied in 100 gallons water per acre.

29. _____
1959. Polythene bags for movements of forest nursery stock. Empire Forest. Rev. 38(1): 65-76.

Polyethylene bags were tested in England to reduce drying of nursery stock during storage and transport. Sitka spruce seedlings lifted beginning in mid-November and stored up to 6 months survived outstandingly well after planting.

30. _____
1960. A preliminary experiment on conifer seedbeds with 2, 6-dichlorobenzonitrile. Fifth Brit. Weed Contr. Conf. Proc. 1960: 617-624.

The material, worked into the top 2-3 inches of conifer seedbeds at 1 or 2 pounds per acre (active principle), completely controlled annual weeds from the time of application until mid-July, when it was applied as a wettable powder 8, 4, or 2 weeks before the plots were sown in early April or early May. The number and height of Sitka spruce seedlings was seriously reduced by applications of 2 pounds per acre and by some, but not all, applications of 1 pound; on plots treated with 1 pound per acre 4 or 8 weeks before sowing, weed control was good and Sitka spruce seedlings were undamaged. Applications of one-half pound per acre had little effect on crop or weeds. Surface applications also had little effect on crop or weeds. (From author's summary.)

31. _____
1961. Experiments in hand-weeding of conifer seedbeds in forest nurseries. Weed Res. 1(1): 59-67.

32. _____
1962. A survey of Dunemann seedbeds in Great Britain. Quart. J. Forest. 56(3): 185-196.

Describes results obtained from raising seedlings in Dunemann seedbeds as compared with results obtained with mineral seedbeds. Includes recommendations for the construction and operation of the beds.

33. _____
1962. Simazine--a weedkiller for forest nurseries. *In* Report on forest research for the year ended March 1961. Great Brit. Forest. Comm., pp. 154-165. London: H. M. Stationery Office.

34. _____
1962. Provenance of Sitka spruce: an account of the nursery stage of experiments sown in 1938. *In* Report on forest research for the

year ended March 1961. Great Brit. Forest. Comm., pp. 147-154. London: H. M. Stationery Office.

Reports the first 3 years' growth of 12 provenances collected between latitudes 61° and 43° N. from the northwest coast of America. Height growth increased as latitude decreased, especially in the range 61° to 49°, the taller provenances having the longer growing period; root-collar diameter and seedling weight did not vary with latitude of origin so clearly. The time of cessation of growth in late summer varied by up to 3 months, the last provenances to stop growing being damaged by frost. (From author's summary.)

35. _____ 1964. The effect of paraquat, 2, 6-dichlorothiobenzamide and 4-amino 3, 5, 6-trichloropicolinic acid ('Tordon') on species planted in the forest. Seventh Brit. Weed Contr. Conf. Proc. 1964(1): 267-275.

36. _____ 1964. Cold storage of forest nursery plants. An account of experiments and trials; 1958-63. Forestry 37(1): 47-63.

Sitka spruce seedlings were found suitable for storage from February until late May. Seedlings may be stored until August if surplus seedlings are being held over. Plants must be fully dormant when lifted, must not be put into storage until any rain or dew has dried off them, and should be stored in polythene bags.

37. _____ 1965. Bitumen mulches. *In* Report on forest research for the year ended March 1964. Great Brit. Forest. Comm., pp. 15-16. London: H. M. Stationery Office.

Bitumen mulch sprayed on seedbeds 3 to 4 weeks after sowing depressed germination of Sitka spruce drastically. For transplants, light and heavy application of bitumen between or over rows had no significant effect on survival or growth.

38. _____ 1965. Chemical control of weeds in the forest. Great Brit. Forest. Comm. Leafl. 51, 20 pp., illus.

Selective control of herbaceous and young broadleaved woody weeds can be accomplished with 2,4,5-T or a mixture of 2,4-D and 2,4,5-T, if spraying is done after conifer shoots have ceased elongation and formed buds. Sitka spruce is relatively resistant to sprays applied after mid-August.

39. _____ 1965. Fertilizer damage to transplants. *In* Report on forest research for the year ended March 1964. Great Brit. Forest. Comm., p. 16. London: H. M. Stationery Office.

Experiments at three nurseries with seedlings transplanted in the late spring showed Sitka spruce seedlings were unaffected by double the standard application of potassic superphosphate. *Abies procera* and *Picea abies* seedlings showed marked browning of foliage.

40. _____
1966. Paraquat as a pre-emergence spray for conifer seedbeds. *In* Report on forest research for the year ended March 1965. Great Brit. Forest. Comm., pp. 133-140. London: H. M. Stationery Office.

In experiments in 1962-64, preemergence sprays of paraquat did not affect most of the commonly sown conifers including Sitka spruce. The control of weeds achieved with paraquat at 0.5 pound active ingredient per acre was sometimes better and sometimes poorer than that following sprays of vaporizing oils. Postemergence sprays killed all conifer species under test, but pines and spruces took several weeks to react to postemergence sprays. (From author's summary.)

41. _____
1966. The effect of paraquat, 2, 6-dichlorothiobenzamide and 4-amino 3, 5, 6-trichloropicolinic acid ('Tordon') on species planted in the forest. *In* Report on forest research for the year ended March 1965. Great Brit. Forest. Comm., pp. 141-149. London: H. M. Stationery Office.

42. _____
1966. Bracken control in forestry with dicamba, picloram, and chlorthiamid. Eighth Brit. Weed Contr. Conf. Proc. 1966: 150-159.

43. _____
1967. Spacing in transplant lines. *In* Report on forest research for the year ended March 1966. Great Brit. Forest. Comm., p. 25. London: H. M. Stationery Office.

44. _____
1967. Review of research and development in forest nursery techniques in Great Britain, 1949-1966. Great Brit. Forest. Comm. Res. & Develop. Pap. 46, 11 pp.

45. _____
1967. Standards of sturdiness for forest tree plants. Great Brit. Forest. Comm. Res. & Develop. Pap. 36, 11 pp., illus.

Lists ratios of diameter to height for a range of species, including Sitka spruce.

46. _____
1967. Progress report on chlorthiamid ('Prefix') in forestry: 1962-1966. Great Brit. Forest. Comm. Res. & Develop. Pap. 49, 6 pp.

Sitka spruce was less affected by the herbicide chlorthiamid at 4 pounds per acre than most species tested.

47. _____ and Atterson, J.
1962. Nursery investigations. *In* Report on forest research for the year ended March 1961. Great Brit. Forest. Comm., pp. 19-27. London: H. M. Stationery Office.

48. _____ and Atterson, J.
1963. Nursery investigations: storage of plants at low temperatures. *In* Report on forest research for the year ended March 1962.

Great Brit. Forest. Comm., pp. 20-22. London: H. M. Stationery Office.

49. _____ and Atterson, J.
1967. Weed control in the forest. *In* Report on forest research for the year ended March 1967. Great Brit. Forest. Comm., pp. 70-73. London: H. M. Stationery Office.

50. _____, Atterson, J., Brown, R. M., and others.
1967. Nursery investigations. *In* Report on forest research for the year ended March 1967. Great Brit. Forest. Comm., pp. 28-39. London: H. M. Stationery Office.

Describes work with Sitka spruce, including investigation of effects of density of sowing, date of sowing (on two provenances), bird repellents, fertilizer treatments, and simazine for weed control.

51. Allen, G. S.
1957. Storage behavior of conifer seeds in sealed containers held at 0° F., 32° F., and room temperature. J. Forest. 55: 278-281.

Indications are that Sitka spruce seed can be stored without appreciable loss of viability at 0° F. or 32° F. and presumably over a wider range of temperatures. Seed at fluctuating room temperature lost its viability over the 5- to 7-year test period.

52. Allen, George S.
1944. Management recommendations for the hemlock and associated forest types of the Juan de Fuca region of southwestern Vancouver Island. Brit. Columbia Forest Serv. Res. Note 11, 13 pp., illus.

53. Allen, M. G.
1962. The use of selective herbicides for conifer release. Sixth Brit. Weed Contr. Conf. Proc. 1962: 435-444.

A study was made in Scotland of damage sustained by different conifer species of varying ages after treatment with a mixture of low-volatile esters of 2,4-D plus 2,4,5-T (2/1 mixture) at three different dosages and in three diluents: water, water/oil, and oil. Plots were sprayed at monthly intervals beginning in September and ending in February. With water, no damage was sustained by any species at any dose. With water/oil, *Pinus sylvestris* and Sitka spruce sustained no serious damage at any dose. With oil, Sitka spruce was damaged at all dosages. Further trials of different formulations and volumes showed that in summer spraying Sitka spruce sustained no injury from 2,4,5-T at 20, 40, or 60 ounces per acre in 15 gallons or 150 gallons water.

54. _____
1967. Experiments with 2, 6-dichlorothiobenzamide (chlorthiamid) in planted areas of soft- and hardwoods. Eighth Brit. Weed Contr. Conf. Proc. 1967: 135-140.

55. Amchem Products, Inc.
1962. Oil-soluble amines of 2,4-D and 2,4,5-T for the control of woody plants and broadleaf weeds. Tech. Serv. Data Sheet, Ambler E-162, 15 pp. [Abstract in Weed Abstr. 11(6): 1847.]

56. American Forestry Association.
1956. These are the champs. Part 2. Amer. Forests 62(4): 33-40, illus.

The largest Sitka spruce reported is in Olympic National Park, Washington. It has a circumference of 51 feet, 6 inches, a height of 180 feet, and a crown spread of 50 feet.

57. American Plywood Association.
1966. U.S. Product Standard PS 1-66 for softwood plywood-construction and industrial together with DFPA grade marks. Tacoma, Wash. 28 pp., illus.

58. Andersen, H. E.
1955. Climate in southeast Alaska in relation to tree growth. USDA Forest Serv. Alaska Forest Res. Center Sta. Pap. 3, 11 pp., illus.

Rainfall in southeast Alaska is probably excessive for optimum tree growth as high rainfall tends to cause an excess of ground water. Best sites are well drained. Low temperatures during the growing season may limit tree growth as shown by the preponderance of high site classes on south slopes and decrease of average site index in the northern section. A compilation of climatic data for southeast Alaska is included.

59. _____
1955. Clearcutting as a silvicultural system in converting old forests to new in southeast Alaska. Soc. Amer. Forest. Proc. 1955: 59-61.

The present stand in southeast Alaska is a decadent climax with heavy cull. The goal of forest management is an even-aged stand composed of approximately equal volumes of western hemlock and Sitka spruce.

60. _____
1955. Girard form class comparisons for three major species in southeast Alaska. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 26, 2 pp.

The average form class of Sitka spruce and western hemlock was respectively 76.4 and 75.8 for 32-foot logs and 82.4 and 82.2 for 16-foot logs. The difference between the species is not significant for either subclimax sawtimber or climax pulp timber, and their mean may be considered as 76 for 32-foot and 82 for 16-foot logs.

61. _____
1956. Cubic-foot volume tables for spruce and hemlock poletimber. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 29, 1 p.

Presents gross cubic-foot volume of peeled wood from a 1-foot stump to a 4-inch top for poles in 6-, 8-, and 10-inch d.b.h. classes and total heights between 20 and 110 feet.

62. _____
1956. The problem of brush control on cutover areas in southeast Alaska. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 33, 2 pp.

A dosage of 54 pounds of crystals per acre of NH_4 sulfamate caused defoliation of nearly all brush. Many hemlock seedlings died but Sitka

spruce proved more resistant. As costs were high and there was much resprouting, other methods of control should be tried.

63. _____ and Weisgerber, J. E.
1956. Use of long-log scaling tables in southeast Alaska. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 32, 2 pp.

Long-log board-foot tables based on Scribner Decimal C rule were made for water scaling logs longer than 42 feet. These were based on a study which indicated that the average taper of western hemlock and Sitka spruce logs in southeast Alaska was 1 inch per 6 feet of log length.

64. Andersen, K. F.
1954. Gales and gale damage to forest with special reference to the effects of the storm of 31st January, 1953, in the northeast of Scotland. Forestry 27: 97-121 plus 1 plate.

Describes storm damage to Sitka spruce and associated species.

65. Anderson, J. P.
1918. Plants of southeastern Alaska. Iowa Acad. Sci. Proc. 1918(25): 427-449.

66. Anderson, Jacob Peter.
1959. Flora of Alaska and adjacent parts of Canada. 543 pp., illus. Ames: Iowa State Univ. Press.

67. Anderson, James R.
1925. Trees and shrubs. Food, medicinal, and poisonous plants of British Columbia. 165 pp., illus. Victoria, B.C.: Dep. Educ.

68. Anderson, M. L.
1930. A case of "damping-off" induced by the use of wood-ashes as a manure on seed-beds. Scot. Forest. J. 44(1): 7-16 plus 2 graphs.

69. Anderson, Mogens.
1951. Balancen I blandingsbevoksninger af rød-og Sitka-gran. [The balance in mixed plantations of Norway and Sitka spruce.] Skovforen. Tidsskr. 36(1): 1-44, illus. [In Danish.]

Describes the effect of light, winter temperatures, drought, soil, position, elevation, damage by wind, and disease on the balance between Sitka spruce and Norway spruce in a Danish plantation.

70. Anderson, R. T.
1937. Pruning green branches of conifers. Quart. J. Forest. 31(1): 29-31, illus.

71. Andrews, H. J., Cowlin, R. W., Moravets, F. L., and Meyer, W. H.
1935. Pulpwood resources of western Oregon and western Washington. USDA Forest Serv. Pacific Northwest Forest & Range Exp. Sta. Res. Note 17, 6 pp. plus 12 tables and 5 figs.

72. Andrews, I. H.
1949. Zinc hydrosulphite treatment of groundwood. Tappi 32: 286-288.

Gives values of improved brightness for various treatment rates and temperatures of ground wood from western hemlock, Sitka spruce, and balsam fir.

73. Andrews, L. R.
1956. B. C.'s timber industry today. Brit. Columbia Lumberman 40(11): 40-48; 40(12): 40-44, illus.

74. Annand, J. F.
1912. The annual summer meeting and tour of the Royal English Arboricultural Society, Perth, July 29th to August 2nd, 1912. Quart. J. Forest. 6: 303-328, illus.

Several specimens of Sitka spruce were viewed during the tour.

75. Appleton, J. B.
1939. The Pacific Northwest: a selected bibliography, 1930/39. 455 pp. Portland, Oreg.: Northwest Regional Council.

Lists completed research in the natural-resource and socioeconomic fields with an annotated list of in-progress and contemplated research.

76. Aranda, Martin J., and Coutts, J. R. H.
1963. Micrometeorological observations in an afforested area in Aberdeenshire: rainfall characteristics. J. Soil Sci. 14(1): 124-133.

Rainfall was measured at an open site and under Sitka spruce, pine, and heather. Between 50 and 60 percent of the rain penetrated each of the canopies. Variations in the percentage penetration are associated with the area of foliage to be wetted and with the aggregate amount and intensity of the rainfall. (From author's summary.)

77. Archer, C. F.
1952. Kiln-drying schedules for British Columbia woods. Can. Dep. Resources & Develop., Forest. Br., Forest Prod. Lab. Div. V-1012, 18 pp.

The wood of all western spruces is practically indistinguishable and can be seasoned under the same conditions. Schedules are given.

78. Armit, D.
1964. Natural nurseries. Brit. Columbia Forest Serv. Forest Res. Rev. (year ending March 1964), p. 26.

Reports on a continuing project to produce Sitka spruce wildlings by manipulating the canopy and forest floor and then comparing these wildlings with seedlings grown in standard nursery beds. Conclusions: 3+0 is superior to 2+0 as a planting size; fertilization does not improve growth of the wildlings; 2+0 standard nursery stock is superior to 2+0 natural nursery stock.

79. ———
1964. Sitka spruce spacing trial. Brit. Columbia Forest Serv. Forest Res. Rev. (year ending March 1964), pp. 29-30.

80. _____
1967. Sitka spruce spacing trial. Brit. Columbia Forest Serv. Forest Res. Rev. (year ending March 1967), p. 67.

Reports on Sitka spruce spacing trials established in 1961 west of Kalum Lake. Spacings range from 6 by 6 to 15 by 15 feet. Measurements of average height in 1966 indicated no significant differences related to spacing or block effects. Crown closure is expected on the 6-by 6-foot plots and possibly on the 9-by 9-foot plots by the next measurement in 1971.

81. Armstrong, F. H.
1935. Further tests on the effect of progressive decay by *Trametes serialis* Fr. on the mechanical strength of the wood of Sitka spruce. Forestry 9: 62-64.

A close relationship was found between reduction in resistance to compression and the progress of decay as measured by the loss in dry weight. Advance of fungal attacks was indicated by an increase in brittleness and irregularity of fracture.

82. _____
1947. The strength of home-grown timber pit-props. Forestry 21(1): 43-76.

Results of strength tests on European and Japanese larch, Norway spruce, Scotch pine, Corsican pine, Douglas-fir, and Sitka spruce showed the spruce to be below average in strength.

83. Arno, Stephen F.
1967. Interpreting the timberline: an aid to help park naturalists to acquaint visitors with the subalpine-alpine ecotone of western North America. 206 pp., illus. San Francisco: U.S. Dep. Int. Nat. Park Serv. Western Reg. Office.

Describes Sitka spruce at timberline throughout its range.

84. Arthur, Joseph Charles.
1934. Manual of the rusts in United States and Canada. 438 pp. plus supplement, illus. Lafayette, Indiana.

The following rusts are found on Sitka spruce: *Melampsorella cerastii*, *Chrysomyxa ledicola*, and *Peridermium parksianum*.

85. Aspinall, G. O., Laidlaw, R. A., and Rashbrook, R. B.
1957. The glucomannans from Sitka spruce *Picea sitchensis*. J. Chem. Soc. (London), pp. 4444-4448.

Hemicellulose fractions composed of *d*-mannose and *d*-glucose residues have been isolated from Sitka spruce holocellulose. A methylated glucan and a methylated glucomannan have been prepared therefrom, hydrolysis affording the corresponding 2 : 3 : 6-trimenthyl ethers. It is concluded that both glucan and glucomannan are linear polysaccharides composed of B-1 : 4-linked sugar residues. (From author's summary.)

The aphid *Adelges cooleyi* = (*Chermes cooleyi*) has been recorded on Douglas-fir and Sitka spruce near Grimstad on the south coast of Norway. This is the first record on Sitka spruce in Norway.

101. Baldwin, E.
1967. A fertiliser trial on deep peat. Scot. Forest. 21(4): 229-231.

Sitka spruce and lodgepole pine were planted on deep peat in 1956 and each seedling received 2 ounces of ground mineral phosphate. A subsequent fertilizer treatment in 1961 containing 14 percent nitrogen, 2.5 percent phosphorus, and 16.5 percent potassium improved growth for a period of time apparently related to the rate of application. Annual shoot growth started to fall off appreciably 4 years after fertilizer application of 500 pounds per acre.

1947. Present and potential sources of tannin in the United States. J. Forest. 45: 729-734.

Sitka spruce bark contains about 25 percent tannin but it has not been used by the tanning industry.

105. Bannan, M. W.
1963. Cambial behaviour with reference to cell length and ring width in Picea. Can. J. Bot. 41: 811-822, illus.

Interrelations between frequency of multiplicative divisions, cell length, and ring width in *Picea* largely resembled those in *Pinus strobus*. Maximum cell length was observed in *P. sitchensis*, and minimum in *P. engelmannii*, which also had fewest multiplicative divisions (the other species studied were *P. glauca* and *P. mariana*). Orientation of the partition in pseudo-transverse division tended to be unidirectional, but reversal of direction of tilt occurred after varying intervals. The connection of these phenomena with the development of spiral grain is discussed.

106. Barrett, John W. (ed.)
1962. Regional silviculture of the United States. 610 pp., illus. New York: Ronald Press.

Presents an area-by-area guide to the biological, physical, and economic aspects of the Nation's continental forest regions and their effect on efficient and productive silviculture practices. Describes silviculture of the major forest type groups of the Pacific Northwest, both in the coastal subzone and the humid transition zone. Description for each group includes the typical site where the group occurs, its place in ecological succession, growth rates, rotations, cultural practices, reforestation, and susceptibility to damage.

1955. Effect of an agricultural spray on forest trees. Quart. J. Forest. 49(2): 139-140.

109. Barton, Lela V.
1930. Hastening the germination of some coniferous seeds. Amer. J. Bot. 17(1): 88-115.

Germination percent was improved by stratifying Sitka spruce seed for 2 months at 5° C.

110. _____
1954. Effect of subfreezing temperatures on viability of conifer seeds in storage. Boyce Thompson Inst. Contrib. 18(1): 21-24, illus.

Seeds of five conifer species, including Sitka spruce, were stored in canvas bags at subfreezing temperatures of approximately -4°, -11°, and -18° C. for 3 years. Storage temperature of -18° C. was found best for maintaining viability. Deterioration was most rapid at -4° C.

111. Bauer, Franz.
1956. Heideaufforstung in Dänemark. [Heathland afforestation in Denmark.] Holz-Zentralbl. 32(136): 1647-1648, illus. [In German.]

Describes two trial plots near Ulvborg, Jutland, on poor, mostly shallow, sandy soils where groups of various species, now 17-23 years old, were established by hole planting under shelter of a first forest generation of *Pinus mugo* and *P. mugo* var. *rostrata*. Height growth and general appearance are discussed and partly tabulated. *Larix japonica*, *Picea abies*, and *P. sitchensis* are considered most promising, and *Abies alba* is recommended on biological grounds.

112. Bauger, E.
1961. Forelopig produksjonstabell for Sitkagran på Vestlandet. [Preliminary yield table for Sitka spruce in W. Norway.] Medd. Vestlandets Forstl. Forsøkssta. 35: 123-167. [In Norwegian. English summary.]

Table is based on data from permanent sample plots in pure stands, none of which exceed 44 years of age.

113. _____ and Smitt, A.
1960. Et treslags-og proveniensforsøk på Stad. [An experiment on tree species and provenances on Stad.] Medd. Vestlandets Forstl. Forsøkssta. 34: 59-121 plus 40 photos, diagram. [In Norwegian. English summary.]

Sitka spruce gave the most promising results of several species tried on a windswept peninsula in west Norway. It was able to withstand wind when growing on good, deep soils with sufficient moisture. An Alaska provenance gave better results than one from British Columbia.

114. Bauger, Eivind, and Orlund, Arnstein.
1962. Undersøkelser etter kvisting I treslagene Sitkagran, *Abies grandis*, hemlock, gran og Thuja. [A study of pruned trees of Sitka spruce, *Abies grandis*, western hemlock, Norway spruce, and *Thuja plicata*.] Medd. Vestlandets Forstl. Forsøkssta. 36: 172-197, illus. [In Norwegian. English summary.]

A study of 2,016 knots led to the following conclusions: (1) pruning (either green or dry, usually at about 2 m.) did not cause rot or other defects of practical importance; (2) pruning season (autumn, winter, and late spring) had no effect; (3) stub length tended to increase with branch diameter, especially for hemlock; (4) the time taken for stub healing tended to increase with stub length and to decrease with increasing knot diameter. Results under (3) and (4) are so variable, however, that no reliable conclusions can be drawn.

1956. Die naturlichen Douglasien-Waldgesellschaften Washingtons and Oregons. [The forest association of Douglas-fir in its natural

range in Washington and Oregon.] Allg. Forst- und Jagdzeit. 127(2/3): 42-56, illus. [In German. English summary.]

Sitka spruce is a principal tree species in the Fog Belt (*gaultherieto-Pseudotsugetum sitchensetosum*) association. Indicator plants are listed for high and low sites.

125. Begley, C. D., and Howell, R.
1960. Air seasoning softwoods at stump. Forestry 33(2): 187-202.

Presents a brief statistical analysis of some practical results obtained from an experiment carried out with Sitka spruce thinnings between 1952 and 1957. Some savings in extraction costs can be expected from reduction in weight. Rate of seasoning differs with different seasons of felling and between peeled and unpeeled poles. Seasoning causes no serious deterioration in the quality of the timber for use as pit-props or boxwood. (Author's summary.)

126. Behrndt, G.
1961. Auftreten und Bekampfung der Sitkalaus im Fruhjahr 1961 im Privatwald des Weser-Ems-Raumes. [Occurrence and control of *Liosomaphis abietina* in private forests of the Weser-Ems region in spring 1961.] Allg. Forstzeitschrift 16(46): 659-661. [In German.]

In Sitka spruce plantations, Metasystox at 0.8 to 1 liter per hectare in 80 to 100 liters water, applied by knapsack sprayer to stands up to 3 meters tall, and to taller stands by helicopter, gave good control. Fogging with a lindane preparation was greatly hampered by wind and dew. Trees with stiff, blue-green foliage appeared to be more resistant than trees with green needles. In untreated areas, the outbreak was controlled by some disease. Costs of application are given.

1953. Nutrition problems in forest nurseries. Rothamsted [England] Exp. Sta. Rep. 1952: 42-45.

134. _____
1959. Nutrition problems in forest nurseries. J. Sci. Food Agr. 10(12): 637-644.

Results from many small-plot experiments in different nurseries and seasons, with Sitka spruce as the main test crop, have shown that it is safe to use commercial fertilizers (Nitro-Chalk, ammonium sulphate, superphosphate, and potassium chloride) in seedbeds and transplant beds. In short-term experiments, testing a range of composts and uncomposted organic materials, with and without additional fertilizer, effects were related to the major plant nutrients present. Interim results of several other experiments are discussed.

135. _____
1963. Comparison of Sitka spruce and Norway spruce in forest nurseries. Rothamsted [England] Exp. Sta. Rep. 1962: 54-55.

Results in nursery plots split between the two species were closely comparable during 1959-62, except for slight color differences caused by K deficiency. Both showed large and consistent height responses to N and P, and well-defined deficiencies were caused by lack of N, K, and Mg. In July 1962, however, after a cold, dry spring, Norway spruce transplants developed a severe red "scorch," associated with dressings of potassium chloride and ammonium sulphate whereas Sitka spruce on the same plots remained green and healthy.

136. _____
1966. Effects of nitrogen and potassium concentration in conifer seedlings on frost damage. Rothamsted [England] Exp. Sta. Rep. 1965: 58-59.

137. _____
1967. Manuring young conifers: experiments in some English nurseries. Fertilizer Soc. London Proc. 94: 5-37.

Manuring experiments dating from 1945 show that Sitka spruce and other conifers are sensitive to soil reaction and prefer acid soils. Soluble fertilizers were generally more efficient than compost on a poor, leached soil, but compost plus fertilizers was most satisfactory. Preliminary results from slow-release fertilizers were promising.

138. _____
1967. Picea sitchensis. Isobutylidene diurea for conifer seedlings. Rothamsted [England] Exp. Sta. Rep. 1966/67: 43-44, plus table.

Describes tests with seedlings in the nursery using IBDU, a slow-acting N fertilizer. Two sizes of granules were used. Heavy rains may have favored IBDU over other formulations; more testing is needed.

139. _____ and Bolton, J.
1966. Calcium as a plant nutrient for Sitka spruce. Rothamsted [England] Exp. Sta. Rep. 1965: 62.

1954. Some results of chemical debarking on Sitka spruce, western hemlock, and red alder. USDA Forest Serv. Pacific Northwest Forest & Range Exp. Sta. Res. Note 104, 7 pp., illus.

Sodium arsenite painted on a sap-peeled girdle on spruce and hemlock during the growing season loosened bark sufficiently to allow peeling of large sections the following year. Breakage during felling was more severe for treated trees.

155. _____
1955. Seedling distribution on a spruce-hemlock clearcut. USDA Forest Serv. Pacific Northwest Forest & Range Exp. Sta. Res. Note 119, 7 pp., illus.

After clearcutting of a spruce-hemlock stand (Cascade Head Experimental Forest, Oregon), 160-milacre regeneration plots were established with five seedbed types: (1) rotten and decomposing wood, (2) mineral soil, (3) surface covered with slash, (4) heavy vegetation, (5) swampy ground. Examination 7 years after clearcutting showed spruce regeneration on 53 percent and hemlock on 44 percent of the plots. Best conditions were provided by (1) (97 percent stocked) and (2) (83 percent stocked); (5) was unstocked. There were more than twice as many seedlings on plots with a north aspect as on those with a south aspect. Accumulations of slash were found to retard growth of trees and other vegetation.

157. _____
1960. Planting Sitka spruce and Douglas-fir on decayed wood in coastal Oregon. USDA Forest Serv. Pacific Northwest Forest & Range Exp. Sta. Res. Note 197, 5 pp., illus.

Four-year survival of Douglas-fir and Sitka spruce on both north and south aspects was the same whether seedlings were planted on mineral soil or on naturally occurring decayed wood. Height growth was as good (or better) on decayed wood as on soil. The decayed wood held moisture late into the summer, was a good medium for root growth, and discouraged competition from other plants. Planting on decayed wood in coastal Oregon is recommended where growing-season precipitation averages at least 10 inches.

158. _____
1961. Growth and development of red alder compared with conifers in 30-year-old stands. USDA Forest Serv. Pacific Northwest Forest & Range Exp. Sta. Res. Pap. 38, 20 pp., illus.

To help provide basic growth data for red alder and associated species, experimental plots were established during the period 1935-37 on the Cascade Head Experimental Forest, near the Oregon coast. Treatments were designed to illustrate potential growth of red alder as it occurs in pure stands at an early age. Growth of these alder stands was compared with growth of a stand thinned to pure conifer--Douglas-fir, Sitka spruce, and western hemlock.

1965. Economics and design of a radio-controlled skyline yarding system. Pacific Northwest Forest & Range Exp. Sta. USDA Forest Serv. Res. Pap. PNW-25, 30 pp., illus.

An analysis of factors affecting time and costs of skyline logging in mature Sitka spruce and western hemlock on the Cascade Head Experimental Forest near Otis, Oreg.

173. Binns, W. O.
1961. Forest soils research in Scotland. *In* Report on forest research for the year ended March 1960. Great Brit. Forest. Comm., pp. 93-94. London: H. M. Stationery Office.

174. _____
1962. Some aspects of peat at a substrate for tree growth. Irish Forest. 19(1): 32-55.

Studies at 12 deep peat sites in Scotland and northern England show that needs of Sitka spruce and other conifers for additional P and K may be estimated from the total P and K contents of the upper layers of the peat.

175. _____
1965. Amelioration of forest sites. *In* Report on forest research for the year ended March 1964. Great Brit. Forest. Comm., pp. 21-22. London: H. M. Stationery Office.

176. _____
1966. Current fertilizer research in the forestry commission. Sixth Discussion Meeting, Edinburgh, Rep., 7 to 9 January. Forestry (Suppl.) 39: 60-64.

Pole-stage experiments have suggested that Sitka spruce is likely to respond to phosphorus on some mineral soils. Sitka spruce has not responded to nitrogen, though other species have. Trials on near-mature crops, following up Scandinavian work, will be started soon. (From author's summary.)

177. _____ and Atterson, J.
1967. Nutrition of forest crops. *In* Report on forest research for the year ended March 1967. Great Brit. Forest. Comm., pp. 48-53. London: H. M. Stationery Office.

Describes results of a demonstration of nutrient deficiencies on Sitka spruce and lodgepole pine. Describes 1966 results on permanent foliage sampling plots established to measure variations of nutrient concentrations in foliage.

178. _____ and Coates, A. E.
1966. Manuring of pole-stage crops. *In* Report on forest research for the year ended March 1965. Great Brit. Forest. Comm., pp. 25-26. London: H. M. Stationery Office.

Describes fertilizer experiments in south and central England and Wales.

179. _____ and Grayson, A. J.
1967. Fertilization of established crops: prospects in Britain. Scot. Forest. 21(2): 81-98.

Application of 88 pounds phosphorus per acre to three pole-stage Sitka spruce stands in Wales resulted in growth increases of 11 to 18 percent over a 7-year measurement period. Experiments on three other Welsh sites failed to increase growth because the primary limiting factor was poor drainage. In general, the Welsh work on pole-stage Sitka spruce indicates that nitrogen can be omitted over a wide range of sites.

180. Bishop, Daniel M., and Stevens, Mervin E.
1964. Landslides on logged areas in southeast Alaska. Northern Forest Exp. Sta. USDA Forest Serv. Res. Pap. NOR-1, 18 pp., illus.

Describes and tentatively analyzes landslides on timbered slopes of mountainous southeast Alaska. Vegetation below timberline is mainly western hemlock and Sitka spruce. Recent large-scale clearcut logging of timber has accelerated debris avalanches and flows on steep slopes.

184. Blair, Sir James Hunter.
1946. Frost damage to woodlands on Blairquhan Estate in April 1945. Scot. Forest. J. 60(1): 38-43.

Presents notes on damage caused by a severe frost (16° F.) following a mild winter and spring. The most extensive damage occurred in plantations of Sitka spruce. Damage varied from complete destruction to crippling; though most severe in frost hollows, it also occurred on sloping ground and even on knolls. Damage was most severe in the young plantations but is also apparent in trees up to 40 feet high and 20 years old. Effects of frost on several other species are described.

185. Blanc, L.
1961. Valeur papetiere, pour papier kraft, des bois resineux exotiques. [The suitability of exotic conifers for kraft paper pulp.] Rev. Forest. Franc. 13(8/9): 558-566, illus. [In French.]

Describes small-scale test of kraft paper made from the pulp of various exotics grown in France, including Sitka spruce, after various degrees of refinement, with graphs illustrating strength properties.

186. Bletchly, J. D., and Taylor, Jean M.
1964. Investigations on the susceptibility of home-grown Sitka spruce (*Picea sitchensis*) to attack by the common furniture beetle (*Anobium punctatum* Deg.). J. Inst. Wood Sci. 12 (May): 29-43, illus.

Describes the effect of the chemical composition and compression wood of Sitka spruce on the development of larvae inserted into blocks.

187. _____ and White, M. G.
1962. Significance and control of attack by the ambrosia beetle (*Trypodendron lineatum*) (Oliv.) (Col Scolytidae) in Argyllshire forest. Forestry 35(2): 139-163 plus 4 photos.

Damage to saw logs of Sitka spruce and other softwood species in Argyllshire forest by pinhole borers was studied and control measures were developed. Most damage was by the ambrosia beetle. Attack begins in April, reaches a peak in May, then declines rapidly and becomes of negligible importance after August. Trees felled between November and January are more susceptible, but few logs left at stump are attacked. Damage is much more widespread in logs stacked in the forests or at the mill. Control methods are discussed.

188. Blew, J. O., Roth, H. G., and Davidson, H. L.
1967. Preservative retention and distribution in several western conifers. Amer. Wood Preservers' Ass., 12 pp., illus.

Preservative retention of Sitka spruce from Oregon and Alaska was erratic but reasonably good. Spruce grown in Oregon performed better than that grown in Alaska.

191. Bollen, W. B., and Wright, Ernest.
1961. Microbes and nitrates in soils from virgin and young-growth forests. Can. J. Microbiol. 7: 785-792.

Penicillium spp. predominated in samples of forest soils except occasionally at depths of 3 inches, when *Mucor* and *Aspergillus* spp. were sometimes more abundant. Incubation for 30 days at 28° C. and 40 percent moisture capacity frequently increased the percent of *Mucor* as well as of *Penicillium* spp. *Mucor* spp. were consistently more predominant in soils associated with alder than in other coastal soils. The greatest concentration of N as NO_3 in unincubated soils was found in a young red alder stand. Samples of soil from stands of virgin coastal redwood showed no NO_3-N. Soils from stands of virgin Sitka spruce, however, showed considerable NO_3 content, which increased markedly with incubation. With few exceptions, bacteria and actinomycetes were most numerous in the F soil horizon. Incubation greatly increased these populations in most soils. (From author's summary.)

192. Bollen, Walter B., Chen, Chi-Sin, Lu, Kuo C., and Tarrant, Robert F.
1967. Influence of red alder on fertility of a forest soil, microbial and chemical effects. Forest Res. Lab. Oreg. State Univ. Res. Bull. 12, 61 pp., illus.

Describes microbial and chemical characteristics of the soil under adjoining stands of conifer (including Sitka spruce), alder, and mixed alder-conifer.

Includes botanical description of Sitka spruce, page 164. Referred to as *Pinus sitchensis*.

198. Booth, H. A.
1940. The growing of Sitka spruce for pitprops. Quart. J. Forest. 34: 72-74.

Measurements of two Sitka spruce stands about 35 years old showed 1,150 and 1,100 poles per acre, with a volume inside bark of 3,929 and 3,817 cubic feet, respectively, corresponding to nearly 50,000 lineal feet of props per acre. The two stands were underthinned, and it is suggested that deliberate underthinning might be used to produce a large number of stems per acre and to improve quality resulting from closer growth rings. Sitka spruce is tolerant of poor soils and should be a desirable tree to grow on a short rotation for pitprops, if the site is within 50 miles of a colliery.

199. Borchers.
1952. Folgerungen aus den bisherigen Anbauergebnissen mit fremdländischen Holzarten im Gebiet des Landes Niedersachsen für die künflige waldbauliche Planung. [Conclusions to be drawn for future silvicultural planning from the results so far obtained in trials of exotic tree species in Niedersachsen.] Mitt. Deut. Dendrol. Ges. (Jb. 1951/52) 57: 68-81. [In German. English summary.]

Describes several plantations of various species, including Sitka spruce.

1944. Opbevaring af Rødgran-og Sitkagranfrø. Foreløbige Forsøgsresultater. [Storage of Norway and Sitka spruce seed. Preliminary results of experiments.] Dansk Skovforen. Tidsskr. 29: 257-263, illus. [In Danish.]

Describes tests of seed storage. Best results came from seed stored at 4- to 8-percent moisture content in a dark, frost-free cellar. Such seed retained its viability unchanged for 2 years.

204. _____
1946. Sitka-Hvidgran-Bastarden. [The Sitka X white spruce hybrid.] Dansk Skovforen. Tidsskr. 31: 42-46. [In Danish.]

Sitka X white spruce hybrids are said to have existed in the Danish Forest Research Organization's nurseries as long ago as the end of the last century and to have been shorter branched but not inferior to pure Sitka in growth. Performance in relation to seed origin is discussed.

205. _____ and Ladefoged, Kjeld.
1940. Hvidgranens og Sitkagranens Dødelighed i Hede-og Klitplantager i 1938 og 1939. [Cold damage to white spruce and Sitka spruce in heath and dune plantations during 1938 and 1939.] Forstl. Forsøgsv. Danmark 15(4): 209-232, illus. [In Danish.]

During the winter of 1938-39, severe frost damage was observed on white spruce, Sitka spruce, and Douglas-fir. This was the result of an unusually high temperature in March (6.5° to 10° C. above the normal temperature) that was followed by very low April temperature--3.8° C. below zero. The cambial zone had commenced activity previous to the April frost and was severely injured.

1923. Decays and discolorations in airplane woods. U.S. Dep. Agr. Bull. 1128, 51 pp., illus.

Discusses general wood specifications and the significance of many typical discolorations and decays in regard to the suitability of timber for aircraft construction. Sitka spruce is described as the most important wood used for this purpose.

215. _____
1929. Deterioration of wind-thrown timber on the Olympic Peninsula, Washington. U.S. Dep. Agr. Tech. Bull. 104, 28 pp., illus.

Following the January 29, 1921, windstorm, Sitka spruce deteriorated less rapidly than western hemlock and Pacific silver fir, but more rapidly than Douglas-fir and western redcedar. Most of the loss for the first three seasons was due to ambrosia beetles and blue stain in the sapwood. Decay became more important after the fourth season, and by the summer of 1926, the sapwood of all species had been virtually destroyed. Considerable Sitka spruce heartwood had been rotted. By the summer of 1926, total loss in Sitka spruce was 46.3 percent of the board-foot volume and 41.7 percent of the cubic-foot volume.

216. _____
1930. Decay in Pacific Northwest conifers. Yale Univ. Osborn Bot. Lab. Bull. 1, 51 pp., illus.

Presents information in a nontechnical style for landowners, lumbermen, foresters, and forestry students, enabling them to recognize the decays of commercially important softwoods in the Pacific Northwest and apply this knowledge in cruising and scaling. (From author's explanation.)

1967. Timber improvement. I. A study of the variation in the wood characteristics in the young Sitka spruce. Forestry 40(2): 117-128.

A study of variation in some wood characteristics in Sitka spruce indicated a similar pattern of within-tree variation in density, tracheid length, and grain inclination for both selected and average final crop trees. There was an appreciable variation in these characteristics between trees of comparable ages, indicating the potential for improvement by selection. There was a reduction in density and some increase in grain inclination, but no difference in tracheid length in vigorous compared to average-growth trees at comparable ages. There was no evidence that selection for above-average density would have an adverse effect on tracheid length; it tends to favor trees having a high minimum wood density and, to a limited extent, wood with narrow cells. (From author's summary.)

225. Briegleb, P. A.
1940. Spruce-hemlock forest shows prodigious growth. USDA Forest Serv. Pacific Northwest Forest & Range Exp. Sta. Res. Note 31: 1-2.

Data from 11 plots established on the Cascade Head Experimental Forest near Otis, Oreg., showed that at age 89 a stand of spruce-hemlock had a volume of 22,530 cubic feet or 262 cords per acre. Species composition was 54 percent hemlock, 45 percent Sitka spruce, and 1 percent Douglas-fir.

245. Brown, L. L.
1921. Canadian Sitka spruce: its mechanical and physical properties. Can. Dep. Int. Forest. Br. Bull. 71, 39 pp.

Sitka spruce from the Queen Charlotte Islands is stronger than that grown on the mainland in southern British Columbia by approximately 3 to 14 percent. Density is not readily apparent because of the similar color of springwood and summerwood and the gradual transition from one to the other. Strength increases from the pith outward. Strength of small, clear pieces of Sitka spruce increases very rapidly when dried below the fiber-saturation point, which is about 31 percent moisture, based on dry weight of the wood. Increase in moisture above the fiber-saturation point does not influence the strength of the wood. Curves are presented by which the strength of any piece of clear Sitka spruce can be closely estimated from its density.

1963. Pulp and paper: effect of fibre form on pulp properties. Great Brit. Dir. Forest. Prod. Res. Rep., Princes Risborough 1962: 40-42.

Pulp was prepared from each of 21 annual rings in a single internode of a Sitka spruce tree. Preliminary results of tests are discussed.

252. _____ and Doman, L. S.
1940. Fire resistance--the comparative resistance to fire of various species of timber. Wood 5(1): 19-23, illus.

Sitka spruce was tested along with 77 other species for inflammability, flame penetration, rate of burning, fire resistance, and the results were compared. Fire resistance was found to be "low."

253. _____ and Pearson, F. G. O.
1955. The quality of Sitka spruce grown in Great Britain. Empire Forest Rev. 34(2): 144-153, illus.

An account of an investigation into the "quality," as measured by specific gravity, of Sitka spruce from six plantations in Great Britain. Within the tree, specific gravity tended to be high near the pith, fell to a minimum about 15-20 rings from the pith, and then increased steadily to the cambium layer. This pattern occurred in every tree examined from each site. Strength in compression was generally proportional to specific gravity, with the addition of a superimposed trend of increasing specific strength from pith to cambium, so that the high-density material at the pith did not have correspondingly high strength. The specific gravity of the wood accruing at a uniform age of 30 years is directly related to the latitude of growth, the heaviest wood being from trees in southern England and the lightest from trees in northern Scotland. (From author's summary.)

1954. Yellow laminated root rot of Douglas-fir. Can. J. Bot. 32: 69-81.

Describes a variety of *Poria weirii* that attacks several species of conifers, including Sitka spruce, in British Columbia.

259. Bunnell, F. L.
1965. Variations in pollen morphology of selected conifers native to British Columbia. 60 pp. (B.S. in Forestry thesis on file at Univ. Brit. Columbia.)

Describes Sitka spruce pollen grains. There was significant variation in pollen morphology between certain of the sample trees.

260. Burley, J.
1964. Effect of gibberellic acid on seed germination of Sitka spruce. Forest Sci. 10: 206-208.

Concentrations of 0.1, 1.0, and 10 p.p.m. compared with distilled water caused no significant differences in germination rate or capacity. A solution of 100 p.p.m. significantly reduced germinative capacity at 35 days. A table summarizes the conflicting results obtained by 14 authors on the effects of gibberellin on the germination rate and capacity of 15 other conifers.

261. Burley, Jeffery.
1965. Genetic variation in *Picea sitchensis* (Bong.) Carr. 203 pp., illus. Ph.D. thesis, Yale Univ. Ann Arbor: Univ. Microfilms, Inc. (Diss. Abstr. 26(4): 1847.)

262. _____
1965. Genetic variation in *Picea sitchensis* (Bong.) Carr. A literature review. Commonwealth Forest Rev. 44(1): 47-59.

Describes the nature and importance of genetic variation in forest trees, with particular reference to Sitka spruce. The literature referring to patterns and nomenclature of variation is reviewed and it is concluded that the concepts of clinal and ecotypic variation are not mutually exclusive. The natural distribution of Sitka spruce is illustrated and the literature on variation in individual characters is discussed. With the exception of wood qualities, anatomical and morphological traits have received little attention. Most research has been concentrated on variation in total growth and survival as determined from provenance tests. On the basis of its long and continuous range, and from a consideration of the literature, Sitka spruce might be expected to show gradual variation with respect to latitude. However, the number of characters studied and the intensity of sampling have been too low to allow a detailed analysis of the variation pattern. (Author's summary.)

263. _____
1965. Variation in seed characteristics of Sitka spruce. Advancing Frontiers Plant Sci. (New Delhi) 10: 11-24, illus.

Variations in seed characteristics were studied using bulk collections from 30 sources. Seed weight was not significantly related to latitude, but there was a tendency for northerly provenances to have heavier seed. Germination rate was improved by cold soaking, but germinative capacity was not affected by soaking, gibberellic acid, or alternating temperatures. Differences in embryo size and cotyledon numbers are discussed.

264. _____
1965. Karyotype analysis of Sitka spruce, *Picea sitchensis* (Bong.) Carr. Silvae Genet. 14(4): 127-132., illus.

No statistically significant differences were observed in the basic haploid karyotypes of 10 provenances, and the data were pooled to obtain the karyotype of the species. However, there was a significant increase in total haploid complement length and nuclear volume as latitude of seed origin increased. (From author's summary.)

265. _____
1966. Genetic variation in seedling development of Sitka spruce, *Picea sitchensis* (Bong.) Carr. Forestry 39(1): 68-94., illus.

Development of the terminal bud in 1-year seedlings is illustrated and described as a continuous process. The same sequence of morphological events occurred in 47 provenances examined, but timing was different. Flushing was controlled largely by temperature, and the time of flushing reflected temperature regime of the native habitat. The effect of provenance on height growth is discussed.

266. _____
1966. Provenance variation in growth of seedling apices of Sitka spruce. Forest Sci. 12(3): 170-175.

Describes shoot apex development for seedlings of *Picea sitchensis* (Bong.) Carr. from 47 provenances. The three stages previously used to describe this development in other conifers are applicable to this species, but times of initiation and duration of each stage vary among the provenances. Anatomical

evidence confirmed morphological evidence for a pattern of development variation that was closely related to the natural distribution of the species. Elongation and needle production continued into July for seedlings from Alaska and into September for those from California. Bud scale production followed and extended for approximately 1 month. The rest stage extended until April, with only 2 weeks separating the first and last provenances in time of spring flushing. The size and shape of the shoot apex varied during these stages, but the zonation pattern could not be distinguished consistently. (Author's summary.)

267. _____
1966. Variation in colour of Sitka spruce seedlings. Quart. J. Forest. 60(1): 51-54.

Genetic variation was demonstrated among seedlings from 47 provenances of Sitka spruce in the rate of development of stem and needle coloration. The pattern of variation paralleled the natural distribution of the species, reflecting changes in environment through the range. Needle glaucousness was subject to local environmental modification. (Author's summary.)

307. Childs, T. W., and Clark, J. W.
1953. Decay of windthrown timber in western Washington. U.S. Bur. Plant Ind. Forest Pathol. Spec. Release 40, 20 pp.

Measurements in windthrown Douglas-fir, Sitka spruce, western hemlock, and Pacific silver fir indicate that hemlock and silver fir decay rapidly in all local conditions in this region, that Sitka spruce decays fairly rapidly, and that Douglas-fir heartwood is quite durable though its sapwood decays fairly rapidly. Temperature is probably the principal factor, other than diameter, determining the rate of decay in fallen trees. In all species, decay is usually negligible in the first year after windthrow but is well started in the sapwood by the end of the second year.

1964. Sitka spruce terminal damage. Can. Dep. Forest. Forest Entomol. Pathol. Br. Annu. Rep. 1964: 132-133.

Damage to terminal buds of Sitka spruce on the Queen Charlotte Islands is caused primarily by *Epinotia* n. sp. *Zeiraphera* nr. *ratzeburgiana* and a gall midge, *Rhabdophaga* sp. nr. *Swainei*. An eriophyid mite, *Trisetacus grosmanni* (Keifer), is involved mainly in damage to lateral buds. Life histories of these insects are mentioned briefly.

322. _____
1966. Larval descriptions of *Zeiraphera pacifica* Freeman and *Epinotia hopkinsana* (Kearfott) (Lepidoptera: Olethreutidae). Can. Entomol. 98: 703-706, illus.

Full-grown larvae of *Zeiraphera pacifica* Freeman and *Epinotia hopkinsana* (Kearfott) are described and illustrated. Both insects have attracted attention in recent years by their damage to stands of young Sitka spruce on the Queen Charlotte Islands. The larvae destroy the terminal buds, altering form and height growth of the trees. The potential economic significance of these pests has necessitated annual population surveys and biological studies, the effectiveness of which depends in part on identification of the larvae. (From author's summary.)

1950. Committee on nutrition problems in forest nurseries: summary report on 1948 experiments. *In* Report on forest research for the year ended March 1949. Great Brit. Forest. Comm., pp. 60-64. London: H. M. Stationery Office.

Transplant manuring experiments with Sitka spruce in a very acid moorland soil and on a calcareous agricultural soil showed large responses in height to superphosphate applied before lining out and to ammonium sulphate given as a top dressing in April. The only failure was on an unusually acid sandy soil (pH 4.0) where a top dressing with ammonium sulphate checked height growth. Other soluble N fertilizers gave good results.

357. _____
1951. Nutrition problems in forest nurseries. *In* Report for 1950, pp. 40-41. Rothamsted [England] Exp. Sta.

Sitka spruce seedlings showed large responses to each of the major nutrients on very acid soils. In neutral or slightly acid soils of old nurseries, Sitka spruce generally made poor growth even when well manured with compost or fertilizers.

358. _____
1951. Sub-committee on nutrition problems in forest nurseries: summary report on 1949 experiments. *In* Report on forest research for the year ended March 1950. Great Brit. Forest. Comm., pp. 97-105. London: H. M. Stationery Office.

A positive response of Sitka spruce to phosphate was observed. Nitrogen depressed growth during a drought year.

359. _____, Warren, R. G., and Benzian, B.
1951. Nutrition problems in forest nurseries. Rothamsted [England] Exp. Sta. Rep. 1950: 40-41.

Sitka spruce seedlings showed large responses to each of the major nutrients in experiments on very acid soils, but in some of these experiments composts well supplied with N, P, and K gave better results than inorganic fertilizers. It appeared that fertilizer N applied in the seedbeds in spring and in an early summer top-dressing had been leached out of the surface soil during the very wet summer and autumn before the period of most active growth. In the neutral or slightly acid soils of old nurseries, Sitka spruce seedlings generally make very poor growth, even when well manured with compost or fertilizers. In 1950, at several nurseries, there were striking responses on such soils to acidification in previous years by $(NH_4)_2SO_4$ or S. Repeated dressings of $(NH_4)_2SO_4$ appear to provide a safe method of supplying available N and at the same time acidifying the soil. Soil sterilization to prevent damping off is also discussed.

383. _____
1967. Aerial fertilization at Kilmory Forest. Scot. Forest. 21(2): 99-104, illus.

Applications of ground mineral phosphate on small plots of slow-growing Sitka spruce in the West Scotland Conservancy resulted in a tripling of leader growth and led to recent large-scale applications at Kilmory Forest. Regular aerial applications of fertilizer are foreseen as a standard silvicultural practice. Fertilization can also extend the range of highly productive species such as Sitka spruce to infertile sites currently managed for lodgepole pine.

384. _____
1967. Silviculture of the spruces in West Scotland. Forestry 40(1): 37-46.

An account of the silviculture of Norway and Sitka spruce practiced in the West (Scotland) Conservancy of the Forestry Commission in the past 50 years. Present methods are summarized and future developments forecast. A more intensive form of silviculture is advocated for Sitka spruce. (Author's summary.)

385. Day, R. J.
1967. A plea for standard tree name abbreviations. Forest. Chron. 43: 121-134.

The author proposes a system for abbreviating tree names in the vernacular. Simple rules are set forth and a list of abbreviations presented. The following is proposed for *Picea sitchensis:* abbreviation--PI's, English vernacular--Sitka spruce, French vernacular--Epinette de Sitka.

386. Day, W. R.
1928. Damage by late frost on Douglas-fir, Sitka spruce, and other conifers. Forestry 2: 19-30.

387. _____ 1947. On the effect of changes in elevation, aspect, slope, and depth of freerooting material on the growth of European larch, Japanese larch, Sitka spruce, and Scots pine in Mynydd Duu Forest. Forestry 20: 7-20, illus.

388. _____ 1949. The soil conditions which determine wind-throw in forests. Forestry 23: 90-95.

The effect of soil conditions on root development and anchorage against windthrow in Britain is examined briefly. Particular soil and vegetation types are mentioned, with special reference to spruce.

389. _____ 1950. Root disease and butt-rot of conifers. Imp. Forest. Inst. Rep. (Oxford) 1948/49: 11-12.

390. _____ 1950. The drought-crack of conifers. Imp. Forest. Inst. Rep. (Oxford) 1948/49: 12-13.

Cracking occurred over a wide area in Wales and parts of Scotland. An examination of the anatomy of the affected trees showed that drought was the probable cause. Sitka and Norway spruces have been the most seriously affected by drought-crack, but all the conifers commonly grown, except the pines, have been affected. The same phenomenon has also been reported from Denmark.

391. _____ 1950. The fungus flora of spruce stems. Imp. Forest. Inst. Rep. (Oxford) 1948/49: 14.

Borings taken in the main stems of living and outwardly uninjured Sitka spruce showed that they were colonized by various species of fungi. Borings taken in Sitka spruce of the same size elsewhere did not show any fungus flora. This colonization seems to have been made possible by debility caused by disease. The discovery that spruce may bear a fungus flora in their wood, even when they appear to be healthy as judged by the appearance of the crown, is a matter of considerable importance in view of the extensive use of spruces in afforestation in Great Britain.

392. _____ 1950. Forest hygiene. II. The imperfection of the environment and its importance in the management of forests. Empire Forest. Rev. 29(4): 307-315.

Discusses the environmental factors in the development of disease, illustrated by data on the influence of soil profiles on the growth of Sitka spruce.

393. _____ 1951. Root disease of conifers with special reference to the dying of Sitka spruce and its liability to wind-throw. Imp. Forest. Inst. Rep. (Oxford) 1949/50: 12-13.

394. _____ 1951. The fungus flora of live spruce stems. Imp. Forest. Inst. Rep. (Oxford) 1949/50: 13-14.

Isolation made from drought-cracked trees shows that their wood is always colonized by fungi, some of which are hymenomycetes known to cause decay of timber. Most have proved to be either ascomycetes or *fungi imperfecti*. Heartwood of trees that had not suffered from drought-crack or other known injury, but which grew among drought-cracked trees, also contained fungi, though to a lesser extent.

395. _____ 1952. Root disease of conifers in relation to soil conditions. (a). Development of butt-rot in conifers in relation to soil depth. (b). The dying of Sitka spruce. Imp. Forest. Inst. Rep. (Oxford) 1950/51: 13-14.

396. _____ 1953. The fungus flora of the main stem of standing trees. Imp. Forest. Inst. Rep. (Oxford) 1951/52: 15.

Samples of Sitka spruce from Aberdeenshire that had suffered from drought-crack in 1947 showed general infection of the heartwood by *Fomes annosus*. In order to determine whether *F. annosus* was present over any wider area, standing trees were sampled in Pitfichie Forest. Both cracked and uncracked trees were sampled, and all the cracked and most of the uncracked trees had heartwood infected with mycelia. These have not been identified, but *F. annosus* was not present and it is unlikely that most of the mycelia are active in wood destruction.

397. _____ 1953. The growth of Sitka spruce on shallow soils in relation to root disease and wind-throw. Forestry 26(2): 81-95.

398. _____ 1954. Cambial injuries on the main stem of conifers. Imp. Forest. Inst. Rep. (Oxford) 1952/53: 13-14.

399. _____ 1954. Drought crack of conifers. Great Brit. Forest Res. Forest. Comm. Rep. 26, 40 pp., illus.

Norway and Sitka spruce were affected by drought-crack following the exceptional drought of 1947. Drought-crack was shown to be correlated with shallow rooting depth in otherwise good soils. A secondary cause of the injury may be the light, poor structure of the wood and the occurrence of heart rot. A number of fungi associated with the condition are listed.

400. _____ 1955. The place of a species in the forest, with special reference to western North American species of conifer used in Britain. Forestry 28(1): 33-47.

Differences between climates of Queen Charlotte Islands and of England and Wales are discussed briefly. The site tolerance of the principal species

within their own natural range is examined, with particular reference to Sitka spruce. Observing the climatic and edaphic position of species in their natural range suggests their place in Britain.

401. _____ 1957. Sitka spruce in British Columbia: a study in forest relationships. Great Brit. Forest. Comm. Bull. 28, 110 pp. plus 57 plates.

Results of a study, based on fieldwork in two regions of the coastal forest in British Columbia (Graham Island, and Terrace in the Skeena River drainage). Discusses the relationship between soil conditions and growth of Sitka spruce, specifically with respect to rooting depth, root and crown development, vigor, and stand conditions.

402. _____ 1958. Forest pathology: studies in 30- to 35-year-old, even-aged spruce stands with reference to the development of fluting, bark necrosis, and variations in crown density. Imp. Forest. Inst. Rep. (Oxford) 1957/58: 13-15.

403. _____ 1959. The influence of pathogenic factors in the rooting space on the development of even-aged plantations. Advance. Sci. 16(63): 212-236. (Also in 1960 Quart. J. Forest. 54(1): 33-53 and 1960 Empire Forest. Rev. 39(1): 38-53.)

Discusses, with some examples from Norway and Sitka spruce in Britain, the variations in survival and growth rate that occur with varying site-water relationships and soil types and depths. Gives illustrations from Britain, Denmark, Holland, and Germany of soil conditions in which disease (root infection with or without insect attack) of Sitka spruce has occurred as a result of deficiencies in the rooting space.

404. _____ 1960. Bark necrosis of Sitka spruce, Douglas-fir, and Norway spruce. Imp. Forest. Inst. Rep. (Oxford) 1959/60: 15-16.

405. _____ 1962. Notes on the development of the root system with Sitka spruce. Scot. Forest. 16(2): 72-83, illus.

A short discussion, based mainly on field observation, of the factors that appear to be important in the development of long, ropelike roots on Sitka spruce. It is suggested that the physical character of the soil is usually of basic importance, but that chemical and biotic factors often also play a part. (From author's summary.)

406. _____ 1963. The development of Sitka spruce on shallow peat. Scot. Forest. 17(4): 219-236.

407. _____ 1964. The development of flutes or hollows on main stems of trees and its relation to bark splitting and strip necrosis. Forestry 37(2): 145-160.

Field observations of Sitka spruce in Britain showed that flutes and strip necrosis often develop above the junction of two main roots or above a dead root, whereas ridges commonly are associated with actively functioning roots. Flutes, strip necrosis, and stem splitting are attributed to a submarginal supply of water that becomes most critical in the affected areas.

408. _____
1966. Biological aspects of thinning in conifer plantations. Forestry 39(2): 191-212.

Discusses thinning generally, with particular regard to effects of soil variability. Data on Sitka spruce plantations are used as examples.

409. _____ and Peace, J. R.
1946. Spring frosts. Ed. 2. Great Brit. Forest. Comm. Bull. 18, 111 pp., illus.

Sitka spruce was the species of economic importance most extensively damaged by the severe frosts of late April 1945 in Great Britain.

410. Dayton, William A.
1952. United States tree books; a bibliography of tree identification. U.S. Dep. Agr. Bibliogr. Bull. 20, 32 pp.

411. DeBrit, G.
1967. Disease of older stages. Dep. Lands, Ireland, Forest. Div. Forest Res. Rev. 1957/64: 37-40.

Examination of 36 trees marked for cutting in a 56-year-old Sitka spruce plantation revealed 18 trees infected with *Fomes annosus*. Volume loss in infected trees averaged 13.6 percent.

412. Decker, Henry F.
1966. Plants. *In* Soil development and ecological succession in a deglaciated area of Muir Inlet, southeast Alaska. Inst. Polar Studies Rep. 20, Part 4, pp. 73-96, illus.

Discusses the successional status of Sitka spruce and other plants on recently deglaciated land.

413. Decourt, N.
1964. Remarques sur la relation entre les circonférences à hauteur d'homme et les circonférences à hauteur de souche dans les peuplements forestiers. [The relation between g.b.h. and butt girth in forest stands.] Rev. Forest. Franc. 16(3): 216-224. [In French.]

Gives equations for obtaining girth at breast height from butt girth for several conifer species including Sitka spruce.

414. Defenbaugh, James E.
1906. History of the lumber industry of America. Vol. 1, 559 pp. Chicago: The American Lumberman.

415. Deffenbacher, Forrest W., and Wright, Ernest.
1954. Refrigerated storage of conifer seedlings in the Pacific Northwest. J. Forest. 52: 936-938.

Nursery and field comparisons of freshly dug plants showed that survival in Douglas-fir, noble fir, ponderosa pine, and Sitka spruce is not impaired by storage up to 6 months if humidity is held at 90-95 percent and temperature at 33° to 35°F., and if the air is adequately circulated. The roots should be packed in moist, washed shingle-tow (from western redcedar) or in moss, and wrapped in waterproof bundles with tops exposed. Mycorrhizae are apparently unaffected.

416. Delevoy, M. G.
1907. Naturalisation des essences exotiques. L'Epicea de Sitka. Ann. Gembloux 17(7): 378-400, illus. [In French.]

1957. Continuous forest inventory of British Columbia. Victoria. Brit. Columbia Forest Serv., 223 pp., illus., plus map and tables.

Gives a comprehensive inventory of the forests of British Columbia including the coastal Sitka spruce zone.

418. DeSilva, J. A. M.
1961. Moisture relations of Sitka spruce (*Picea sitchensis* Carr.) seedlings under conditions of varying soil moisture supply. J. Oxford Univ. Forest. Soc. 5(9): 21-26, illus.

Experiments on 1-year seedlings of Sitka spruce, sampled direct from the seedbed and grown in containers in which the soil was allowed to dry out, have shown that as the soil moisture fell below field capacity the water deficit in the needles increased and transpiration decreased. (From author's summary.)

419. Dick, James.
1954. The effect of tetramine rodent repellent coating of certain lots of Sitka spruce and western hemlock seed. Weyerhaeuser Forest. Res. Note 24, 2 pp., illus.

420. Dickson, D. A.
1966. The effect of nitrogenous and phosphatic fertilisers on the growth of checked trees on deep peat. Northern Ireland. Min. Agr. Res. Rec. 1965, 14(2): 61-71, illus.

Presents results of an investigation into the mineral nutrition of Sitka spruce and Contorta pine planted 24 years before, on deep ombrogenous peat. Analysis was made of nutrient content in foliage and in peat. It is concluded that, under the conditions investigated, the single application of large quantities of soluble mineral fertilizers to checked plantations is not an efficient practice.

421. _____
1966. The effect of nitrogenous and phosphatic fertilisers on the growth of checked trees on deep peat. Forest. N. Ireland 7(3): 18-32, illus.

422. Dickson, J. A., and Innes, R. A.
1959. Forestry in North Scotland. Forestry 32(1): 65-109.

Discusses forestry in North Scotland, including the role of Sitka spruce.

423. Dietrichson, Jon.
1961. Bruker vi mellomeuropeiske provenienser riktig? [Are central European provenances being used correctly in Norway?] Norsk Skogbruk 7(2): 67-70, illus. [In Norwegian.]

Discusses the resistance of various provenances to autumn frosts and summarizes briefly studies on the date of completion of growth of pine, spruce, Douglas-fir, Sitka spruce, and western hemlock.

424. Dinwoodie, J. M.
1962. Some ring-width patterns in Sitka spruce timber from North America. Forestry 35(1): 22-26.

Variations in ring-width pattern of Sitka spruce through most of its life in its natural habitat are demonstrated from photographs of 10 cross sections. It is suggested that, besides being subject to the annual fluctuations in growth due to climatic variation, the tree in the natural forest is subject to periodic suppression and release, and that it has considerable powers of recovery. In plantations, therefore, Sitka spruce should respond to thinnings made even late in the rotation. (From author's summary.)

425. _____
1963. Variation in tracheid length in *Picea sitchensis* (Carr.). Great Brit. Dep. Sci. & Ind. Res. Forest Prod. Res. Spec. Rep. 16, 55 pp., illus.

Presents the results of an investigation into the variation in tracheid length in Sitka spruce within the annual ring, within the tree, and between trees of different provenances.

426. _____ and Richardson, S. D.
1961. Studies on the physiology of xylem development. Part II: some effects of light intensity, day length and provenance on wood density and tracheid length in *Picea sitchensis*. J. Inst. Wood Sci. 7: 34-47.

Experiments confirm a previous conclusion that wood density is a function of net assimilation rate, though the effect of low light intensities requires further experimental analysis. Tracheid length appears to be partly determined by the activity of the apical meristem, but there may be more direct effects of temperature and light on tracheid size. The way these factors operate is not yet clear.

427. Dixon, Dorothy.
1961. These are the champs. Amer. Forests 67(2): 41-47.

The largest Sitka spruce is listed as 51 feet, 6 inches in circumference at 4-1/2 feet above the ground, 180 feet tall, and with a crown spread of 50 feet. Location is in the Olympic National Park, Washington.

428. Dodwell, Arthur, and Rixon, Theodore F.

Includes practical information on cone collection, testing, and storage for several species including Sitka spruce.

434. Dowell, M. H. D.
1956. The influence of shade on certain tree seedlings, with particular reference to the regeneration of beech. J. Oxford Univ., Forest. Soc. Ser. 4, 4: 32-42.

The effect of decreasing light intensity on tree seedlings was investigated. Root competition was controlled and soil conditions were maintained at optimum level. One-year-old transplants of Sitka spruce and several other species were grown at Kennington Nursery, Oxford, for 1 year in 4 degrees of shade; 0 percent, 34 percent, 54 percent, and 78 percent of the light being excluded. Measurements were made of dry-weight increments, height growth, root/shoot ratios, mortality, leaf weights and lengths. Weed growth was also assessed.

1892. The value in the British Islands of introduced conifers. J. Roy. Hort. Soc. 14: 73-102.

Abies menziesii (Menzies spruce) or, as it is now called by botanists, *Picea sitchensis*, was introduced by Douglas in 1831. The finest tree recorded in Scotland grows at Castle Menzies and is 46 years old; 96 feet, 6 inches high; and 11 feet in girth. The species was named by Douglas after Archibald Menzies, who first discovered it when accompanying Vancouver on his voyage around the world. Heights and diameters of especially large trees in Britain are mentioned.

Includes a general description of Sitka spruce in Britain.

457. _____
1964. Forestry in Great Britain. Great Brit. Forest. Comm., 28 pp., illus.

Contains a historical review of forestry in Great Britain and describes present forest policy, with a short review of each of the principal trees grown, including site requirements and statistics. Sitka spruce is the most widely planted exotic conifer in Britain because of its resistance to exposure at high elevations or near the sea, its tolerance to acid peats or heathy vegetation, and its rapid timber production. However, it is susceptible to frost damage in valley bottoms. Rapid height growth is common; many trees exceed 100 feet in 30 years. The timber closely resembles that of Norway spruce. Sitka spruce plantations covered 167,000 acres in 1947; the Forestry Commission plants about 17,000 acres annually.

1952. The effects of partial soil sterilization with formalin on the raising of Sitka spruce and other conifer seedlings. Great Brit. Forest. Comm. Forest Rec. 16, 20 pp., illus.

Summarizes 5 years of experimental work and reports experimental data. The best commercial formalin treatment was found to be one-tenth gallon per square yard, diluted with nine to 24 times its volume of water. Under proper conditions, treatment increased the growth of first-year seedlings and reduced the growth of weeds. Adverse effects on seedlings were rare. Costs are discussed.

462. _____
1953. Frost damage to Sitka spruce plants in the nursery and its relation to seed origin. Scot. Forest. 7(2): 51.

In Scotland, Sitka spruce from Queen Charlotte Islands is more resistant to frost than plants of U.S. origin. Experience with seedlings from seed collected in older Sitka spruce woods in Scotland suggests that many of these woods are of U.S. provenance.

463. _____
1959. Use of triple superphosphate for forest manuring. *In* Report on forest research for the year ended March 1958. Great Brit. Forest. Comm., pp. 117-130. London: H. M. Stationery Office.

464. _____
1962. The progress of peat land afforestation in Britain. Irish Forest. 19(1): 102-109.

Attempts to raise mixtures of species on peat lands are now less frequent. Lodgepole pine either pure or with a mixture of Japanese or hybrid larch or *Tsuga* rather than Sitka spruce is planted. Several trial forests are being established in the north of Scotland where blanket bog is the prevailing formation.

1957. Problems in afforestation. *In* Report on forest research for the year ended March 1956. Great Brit. Forest. Comm., pp. 36-39. London: H. M. Stationery Office.

At Croft Pascoe, on the exposed Lizard Peninsula of Cornwall, afforestation experiments on soils derived from serpentine rock have made a promising start. Broom grows vigorously and will be a useful nurse. Of the many tree species tried, Sitka spruce, lodgepole pine (coastal provenance), *Pinus radiata*, and *P. pinaster* show good early growth.

468. _____, Steward, G. G., and Herman, D. W.
1960. Silvicultural investigations in the forest: (B) Scotland and north England. *In* Report on forest research for the year ended March 1959. Great Brit. Forest. Comm., pp. 38-43. London: H. M. Stationery Office.

Analysis of Norway and Sitka spruce trees blown down in the Inverliever pruning experiments, started 19 years ago, showed no ill effects from the pruning of live branches and illustrated again how thin was the layer of knot-free timber produced during that period. This emphasized the necessity of pruning only the largest, most vigorous trees in a crop, and of starting pruning when their breast-height diameter is about 4 inches (earlier than brashing is usually done).

1944. Report for the period from 1st April, 1938 to 31st March, 1943. 65 pp.

Armillaria mellea was the most troublesome fungus during the period under review, especially on Sitka spruce.

470. Eis, Slavoj.
1962. Statistical analysis of several methods for estimation of forest habitats and tree growth near Vancouver, B.C. Univ. Brit. Columbia Fac. Forest. Bull. 4, 76 pp., illus.

The analysis includes the hemlock-Sitka spruce type on the southern fringe of the coastal mountain range between Alouette Lake and Howe Sound below the 300-foot elevation. Plant communities were used as a basis for separation of biologically equivalent forest habitats. It was found that almost all the variability of the plant communities studied could be accounted for by differences in soil and in moisture regime. Using only a few environmental characteristics, it was possible to predict both site index and plant community with an accuracy approaching the result obtained using many factors. Mathematical formulas for predicting site index were calculated.

1948. Forest trees of the Pacific coast. New ed., 565 pp., illus. New York: G. P. Putnam's Sons.

472. Elliott, G. K.
1960. The distribution of tracheid length in a single stem of Sitka spruce. J. Inst. Wood Sci. 5: 38-47.

Examines the pattern of variation within a 41-year stem. The variation radially from the pith outward and longitudinally from the stump upward followed the expected pattern laid down in Sanio's laws. A comparison between the effect of age and ring width on tracheid length showed that age had the stronger effect. From a 68-year cross section of another Sitka spruce, age was shown to have a significant effect on tracheid length only in the early years; as the tree matures the effect of age is superseded by that of ring width. (From author's summary.)

481. Englerth, George H.
1947. Decay of Sitka spruce in southeastern Alaska. J. Forest. 45: 894-900, illus.

Decay was studied in 630 trees on 11 plots. Data on age and size of trees and kinds and amounts of decay were recorded. The more important fungi found on living Sitka spruce were *Polyporus schweinitzii*, *P. borealis*, *P. sulphureus*, *Fomes pinicola*, *F. pini*, *F. officinalis*, and *Lentinus kaufmannii*. Sporophores of these fungi, excepting *F. pini*, were produced infrequently or not at all on living trees. No swollen knots were observed in association with *F. pini* infections. In most cases, frost cracks, injuries caused by falling trees, or broken tops provided the only indication of the presence of decay.

482. Erickson, R. W., and Hossfeld, R.
1964. Effect of cationic and nonionic fluorocarbon surfactants on the permeability of wood to water. Tappi 47: 792-795, illus.

1966. Measurements of light intensity. *In* Report on forest research for the year ended March 1965. Great Brit. Forest. Comm., p. 131. London: H. M. Stationery Office.

Describes light intensity measured in openings of various sizes in several Sitka spruce stands in Britain.

492. _____
1967. Light relation of six tree species in the nursery and in the forest. *In* Report on forest research for the year ended March 1967. Great Brit. Forest. Comm., pp. 154-155. London: H. M. Stationery Office.

493. Farquhar, J.
1966. The use of seedlings for forest planting in Scotland and north England. *In* Report on forest research for the year ended March 1965. Great Brit. Forest. Comm., pp. 154-168. London: H. M. Stationery Office.

Survival and height growth of 1-year seedlings of several species including Sitka spruce were poorer than for transplants, and results were less reliable. The use of 1-year seedlings is not recommended.

494. Farrer, R. P.
1951. The use of selective herbicides in forestry in general and in nursery work in particular. Empire Forest. Rev. 30(1): 66-71.

495. Faulkner, R.
1955. Experiments on applying various forms of nitrogen to Sitka spruce seedbeds in Scotland. *In* Report on forest research for the year ended March 1954. Great Brit. Forest. Comm., pp. 91-101. London: H. M. Stationery Office.

Summarizes long-term fertilization trials using nitrochalk, flash, formalized casein, and other materials. Of those tested, nitrochalk was considered most suitable and economical for seedbeds.

496. _____ 1956. Green crops compared with hopwaste as heathland nursery treatments. Great Brit. Forest. Comm. Res. Br. Pap. 19, 10 pp.

Experiments carried out with Sitka spruce showed that, in the first year on new heathland or woodland nursery sites, the main limiting factors to seedling growth are lack of N, P, and K. They also showed that a first-year green crop of oats, grown with the aid of artificial fertilizers and followed by seedbed dressings of NPK fertilizers at standard rates, can provide a stimulus to Sitka spruce seedlings equal to and more consistent than that provided by compost followed by similar rates of NPK fertilizer. Comparative costs and benefits are discussed.

497. _____ 1957. Experiments on seedbed compaction. *In* Report on forest research for the year ended March 1956. Great Brit. Forest Comm., pp. 113-123. London: H. M. Stationery Office.

Investigates the effect of various degrees of seedbed compaction, before and after sowing, on height growth and total yield of seedlings. Sitka spruce was used in all tests. The results indicate that compaction with a roller before sowing gives maximum yield of seedlings. Compaction hastens germination but does not greatly affect height growth. Slightly firming the seed into the seedbed surface and rolling after applying grit covers have little effect on growth and yield of seedlings.

498. _____ 1957. The storage of one-year conifer seedlings. *In* Report on forest research for the year ended March 1956. Great Brit. Forest. Comm., pp. 85-95. London: H. M. Stationery Office.

499. _____ 1958. Investigations into intensive methods of raising conifer seedlings. Empire Forest. Rev. 37(1): 85-95.

Trials in Scotland showed that four crops of Sitka spruce seedlings per year could be raised in a frame with soil temperature (at 2 inches) maintained at 65-70°F. and with artificial illumination extended into the night, but because of difficulties in hardening-off the seedlings, it is impracticable to raise more than two or three crops per year.

500. _____ 1958. Scottish experiments comparing chloropicrin with formalin as a partial soil sterilizer for conifer seedbeds. *In* Report on forest research for the year ended March 1957. Great Brit. Forest. Comm.. pp. 159-170. London: H. M. Stationery Office.

Summarizes the results of experiments started in 1953 at a number of nurseries. It was found that chloropicrin injected into nursery beds is usually a slightly more effective sterilizing agent than formalin, as shown by height growth and yield of usable 1-year seedlings of Sitka spruce. Time of application and costs are discussed.

501. _____
1958. Summer, autumn or spring lining out? Scot. Forest. 12(3): 127-134.

June and July lining out gave a higher yield of usable transplants and compared favorably with March, the usual period. Lining out in late autumn gave the lowest numbers of usable transplants.

502. _____
1960. Summary of recent research into phosphate and potash manuring of conifers in nursery seedbeds in Scotland and northern England. *In* Report on forest research for the year ended March 1959. Great Brit. Forest. Comm., pp. 126-140. London: H. M. Stationery Office.

Summarizes the results of a long series of experiments. There is no danger in applying P or K fertilizers on the day of sowing if they are well mixed with the soil. Equally good results are obtained if applied earlier, up to 16 weeks before sowing. The currently recommended rate of 14 pounds of superphosphate per 100 square yards of nursery bed is satisfactory for Japanese larch, western hemlock, and Douglas-fir, but for Sitka spruce 1-1/2 to 2 times this amount is recommended. For all four species, applications of K_2SO_4 at 4 to 5 pounds per 100 square yards are generally adequate.

503. _____
1960. Summary of recent research into nitrogen manuring of conifers in nursery seedbeds in Scotland and northern England. *In* Report on forest research for the year ended March 1959. Great Brit. Forest. Comm., pp. 141-160. London: H. M. Stationery Office.

1966. Forest genetics. *In* Report on forest research for the year ended March 1965. Great Brit. Forest. Comm., pp. 59-60. London: H. M. Stationery Office.

A total of 131 candidate Sitka spruce plus trees have been selected. Sitka spruce has been a difficult species to propagate from cuttings or by grafting. Recent results from August-September tests showed 60-percent rooting of cuttings taken from the 12th internode from the top of the trees and treated with a mild indole acetic acid rooting hormone powder.

513. _____, Herbert, R. B., and Fletcher, A. M.
1967. Forest genetics. *In* Report on forest research for the year ended March 1966. Great Brit. Forest. Comm., pp. 66-69. London: H. M. Stationery Office.

514. _____, Herbert, R. B., and Fletcher, A. M.
1967. Forest genetics. *In* Report on forest research for the year ended March 1967. Great Brit. Forest. Comm., pp. 91-95. London: H. M. Stationery Office.

A total of 332 candidate Sitka spruce plus trees have been selected, and propagation in tree banks by grafting is now keeping abreast of the rate of selection. A national tree bank was started at Wauchope Forest, Roxburghshire, Scotland. Data on success of vegetative propagation are given. An attempt to grow Sitka spruce progenies under glass for more than one growing season was unsuccessful because plants developed abnormally in the second year. The problem appears to be associated with a winter-chilling requirement.

544. Fraser, A. I.
1962. The soil and roots as factors in tree stability. Forestry 35(2): 117-127.

Effects of drainage and peat depth on the rooting and stability of 34-year-old Sitka spruce were studied at Forest of Ae in Dumfries and Kielder Forest of Northumberland. It was concluded that relatively small increases in rooting depth obtained by drainage of peat soils can produce considerable increase in resistance to blowdown. Drainage also increased the mechanical strength of the soil. On a freely drained site, Sitka spruce developed a vertical root system, and it is not completely correct to consider it a shallow-rooted species.

1965. Wind stability: tree-pulling investigations. *In* Report on forest research for the year ended March 1964. Great Brit. Forest. Comm., pp. 35-36. London: H. M. Stationery Office.

546. _____
1965. The uncertainties of wind-damage in forest management. Irish Forest. 22(1): 23-30.

Wind damage to Sitka spruce and other plantations in Britain can be reduced by recognition of high hazard areas and silvicultural treatment to reduce the hazard. Soil condition is a major factor in tree stability, and

soil mapping, particularly to identify poorly drained soils, is desirable. Soil drainage is recommended depending on age and height of plantations. Sitka spruce growing on deep soils should be thinned early and regularly.

547. _____ and Gardiner, J. B. H.
1967. Rooting and stability in Sitka spruce. Great Brit. Forest. Comm. Bull. 40, 27 pp., illus.

Describes investgations in north Wales and the English-Scottish borders. The effect of nutrients, drainage, stand characteristics, and topography are discussed.

555. Frey, R. W., and Clarke, I. D.
1941. Tannin content of Sitka spruce bark. J. Amer. Leather Chem. Ass. 36: 576-584, illus.

The average tannin content of 31 samples of Sitka spruce bark from Washington and Oregon was 24.1 percent, the individual results varying from 11.2 to 37.2 percent. Tannin content was related both to position in tree and age of tree, increasing with height from the ground and, at least for bark near the butt end, decreasing with age of tree. The tannin is of the catechol type. Total sugars in the bark ranged from 3.3 to 12.4 percent,

increasing with height from the ground and decreasing slightly with age of tree. Sitka spruce bark is very thin and would give a low yield per tree, so a large volume of tanning extract could not be produced from this source alone.

556. Friedrich, Alexander Gunther.
1951. Untersuchungs-ergebnisse zum "Alten und Neuen" über die Sitkafichte (*Picea sitchensis* Carr.). [Results of past and present researches on Sitka spruce.] Forest- und Holz 6(3): 37-38. [In German.]

The susceptibility of Sitka spruce to attack by *Fomes annosus* and (subsequently) *Dendroctonus micans*, makes it inadvisable to plant it in mixture with other species also subject to *F. annosus* attack. In coastal areas with high rainfall, Sitka spruce gives good results when planted on windy and water-logged sites. Mixed stands on such sites should be well tended and watched for *F. annosus*.

1959. Soil fauna research. *In* Report on forest research for the year ended March 1958. Great Brit. Forest. Comm., p. 116. London: H. M. Stationery Office.

Reports effects of establishing a Sitka spruce plantation on a population of soil-inhabiting mites.

575. Gilpin, W. J.
1965. The relation of crown width to D.B.H. and total height in open and forest grown Sitka spruce. 39 pp. (B.S. in Forest. thesis on file at Univ. Brit. Columbia.)

The relation of crown width to diameter at breast height and total height for open and forest grown Sitka spruce was examined. Three characteristics of open grown and forest grown trees were assessed by computer analysis. Multiple regression equations for estimation of crown width of open grown and forest grown trees were developed. Analysis of variance showed most of the variation in crown width could be accounted for by total height in both open and forest grown trees.

576. Gladman, R. J., and Greig, B. J. W.
1965. Principal butt rots of conifers. Great Brit. Forest. Comm. Booklet 13, 8 pp. plus 10 plates.

A forester's guide to the three most common and damaging decays of standing conifers in Great Britain, caused by *Fomes annosus*, *Armillaria mellea*, and *Polyporus schweinitzii*. Descriptions and illustrations show the gross characteristics of the fungi, and the rots they cause. (Some illustrations are in color.)

577. Glaser, H.
1955. Untersuchungen über die chemische Entrindung und ihre Anwendbarkeit in deutschen Wäldern. [Investigations on chemical barking and its applicability in German forests.] 87 pp., illus. Frankfurt-am-Main: J. D. Saverlander. [In German.]

Briefly surveys experimental work and experience gained in chemical debarking in countries outside Germany and includes a detailed description of the author's own tests in Germany over the period 1950-53. Sitka spruce peeled easily after chemical treatment.

578. Gockerell, E. C.
1966. Plantations on burned versus unburned areas. J. Forest. 64: 392-394.

Clearcut areas were examined for comparison of plantations of Sitka spruce and other conifers on burned and unburned units. Planted stocking is greater on burned areas, but there are fewer natural seedlings than on unburned areas. Average height of trees is greatest on unburned areas. Browsing by elk and deer is heaviest on burned areas.

579. Godman, R. M.
1949. What kind of trees make the best growth in southeast Alaska. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 2, 1 p.

The average second-growth stand in southeast Alaska is composed of approximately equal proportions by volume of Sitka spruce and western hemlock. Remeasurement of four sample plots after 20 years showed that spruce increment is far greater than hemlock. Both species increase their rate of growth as they increase in diameter. Spruce outstrips hemlock in every vigor class.

580. _____
1951. Thinning second-growth hemlock-spruce for pulpwood. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 7, 1 p.

Reports on a test of two thinning methods: leaving 120 crop trees per acre, and leaving two-thirds of original basal area.

581. _____
1952. A classification of the climax forests of southeastern Alaska. J. Forest. 50: 435-438.

Presents a classification scheme for the climax forests of southeast Alaska, a component of which is Sitka spruce. The average number of 16-foot logs to a 6-inch top diameter inside bark of trees in and above the average stand diameter was found to be the most practical single indicator of stand characteristics in the climax forests. Log height is roughly indicative of species composition. The stands are described in detail.

582. _____
1953. Seed dispersal in southeast Alaska. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 16, 2 pp.

A bumper cone crop in 1951 produced 91 pounds of seed per acre in a western hemlock-Sitka spruce stand in the Juneau area of the Tongass National Forest. Seed fall by month is tabulated.

583. _____
1953. Moss retards regeneration in southeast Alaska. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 18, 1 p.

584. _____
1953. Seasonal distribution of leader growth. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 19, 2 pp.

585. _____
1953. Seasonal distribution of radial growth. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 20, 1 p.

Radial growth at breast height began about May 15 in the Ketchikan area of the Tongass National Forest. For old-growth Sitka spruce, 50 percent of the increment was complete in 7-1/2 weeks, and appeared to terminate at 17 weeks. For second-growth spruce, 90 percent of the increment was complete in 11-1/2 weeks and growth was essentially complete by the 14th week. Weekly periodic and cumulative percentages of radial increment for old-growth and second-growth Sitka spruce, western hemlock, and western redcedar are given.

586. _____ and Gregory, R. A.

605. Gray, H. R.
1956. The form and taper of forest-tree stems. Imp. Inst., Oxford Univ. Inst. Pap. 32, 79 pp.

Discusses sectional area-to-height relationship for the main stem of various forest-grown trees including Sitka spruce.

606. Great Britain Forest Products Research Board (London).
1951. Wood-water relationships. Great Brit. Forest Prod. Res. Board Rep. 1950: 12-13.

Measurements of the relative-humidity: moisture-content isotherms of Sitka spruce are shown in graphs, where absorption and desorption curves correspond to moisture content from dryness to 32.5 percent and back again.

607. _____
1951. The bending of tropical timbers. Great Brit. Forest Prod. Res. Board Rep. 1950: 22.

608. _____
1952. Electrical properties of wood. Great Brit. Forest Prod. Res. Board Rep. 1951: 51-53.

Describes a study of the effect of moisture content, grain direction and frequency on dielectric constant and loss tangent for Sitka spruce and several other woods.

609. _____
1952. Research on pruning. Great Brit. Forest Prod. Res. Board Rep. 1951: 55-56.

Some 2,900 pruned knots in British-grown Sitka and Norway spruce logs were examined from 76 trees and 29 localities. Measurements of over 1,200 of these knots have shown an average radial healing thickness of just under 0.5 inch of wood. Dissection showed no obviously diseased knots or wood, but symptoms were found in the bark similar to those associated with attack by *Stereum sanguinolentum* or other fungi: It is recommended that green pruning of spruce be avoided in Britain.

610. _____
1953. Seasoning in superheated steam. Great Brit. Forest Prod. Res. Board Rep. 1952: 12-13.

611. _____
1953. The structural use of timber. Great Brit. Forest Prod. Res. Board Rep. 1952: 16-17.

612. _____
1953. Determination of arsenic in wood and foliage. Great Brit. Forest Prod. Res. Board Rep. 1952: 46-47.

Results of analyses, after the removal of the organic matter by digesting the samples with an acid mixture, showed very little arsenic present in needles and wood of Sitka spruce subjected to two different treatments with arsenic applied to standing trees to facilitate bark removal.

613. _____
1953. Diffusion of water vapour through wood. Great Brit. Forest Prod. Res. Board Rep. 1952: 48-49.

Compares grade and strength of Sitka spruce from Scotland and from Kent.

614. _____
1954. Softwood mannan. Great Brit. Forest Prod. Res. Board Rep. 1953: 43.

A polysaccharide containing mannose and glucose units only has been isolated from Sitka spruce.

615. _____
1958. Effect of gamma rays on the hygroscopicity of wood. Great Brit. Forest Prod. Res. Board Rep. 1957: 46.

Sitka spruce specimens were exposed to gamma rays from Co^{60} at dosage levels of 1, 10, and 100 million radiation, and the equilibrium moisture content curves were then determined. Very heavy doses of radiation are needed to affect hygroscopicity (and possibly other physical properties), and the effect is negligible below 10 million radiation.

616. _____
1959. Wood bending: solid bending. Dir. Great Brit. Forest Prod. Res. Board Rep. 1958: 10.

Experiments to determine the bending properties of nine British-grown softwoods, including Sitka spruce, and ash indicated that they were intrinsically superior to many tropical hardwoods tested, but their gross properties and commercial values were adversely affected by knots.

617. _____
1960. Home-grown timber investigations. Dir. Great Brit. Forest Prod. Res. Board Rep. 1959: 5.

Mentions a special instrument designed for measuring the inclination of the grain in cross-sectional disks. This will be used in a study of variations in anatomical structure of Sitka spruce throughout the United Kingdom.

618. _____
1961. *Ambrosia* (pinhole borer) and *Lymexylid* beetles. Damage in coniferous forests, Argyllshire. Dir. Great Brit. Forest Prod. Res. Rep. 1960: 30-31.

619. _____
1961. Effect of specimen size on swelling. Dir. Great Brit. Forest Prod. Res. Rep. 1960: 42-43.

620. _____
1962. Common furniture beetle (*Anobium punctatum*): biology, habits, and nutrition. Dir. Great Brit. Forest Prod. Res. Rep. 1961: 21.

A decrease in nutritional suitability from the bark toward the center in British-grown Sitka spruce was demonstrated by the insertion of larvae into sample blocks and a study of their development.

621. _____
1962. Prevention and control of infestation. Ambrosia beetles. Dir. Great Brit. Forest Prod. Res. Rep. 1961: 24.

622. _____
1962. Effect of pre-compression on strength. Dir. Great Brit. Forest Prod. Res. Rep. 1961: 31.

623. _____
1964. Home-grown timber investigations: compression wood in Sitka spruce. Dir. Great Brit. Forest Prod. Res. Rep. 1963: 9-10.

624. _____
1964. Special apparatus and techniques. Betaray method of density determination. Dir. Great Brit. Forest Prod. Res. Rep. 1963: 10.

Reports on continued work using the C^{14}B-particle technique to examine the density variation in Sitka spruce early wood with a view to selecting trees of above-average density. Preliminary results suggest that early wood density is not necessarily related to the rate of diameter growth and that some fast-growing stems may have early wood of adequate quality.

625. _____
1964. Home-grown investigations. Wind damage in Sitka spruce. Dir. Great Brit. Forest Prod. Res. Board Rep. 1963: 10.

The bulges on one side of the stem, found in 30-year Sitka spruce that had broken off at 8- to 10-foot height, consisted of fast-grown compression wood overlaying a natural compression failure and associated ring shake apparently caused by bending in gales 2 years before.

626. _____
1964. Timber mechanics. Quality and properties of home-grown timbers. Dir. Great Brit. Forest Prod. Res. Board Rep. 1963: 34-35.

Gives results of strength tests on green Norway and Sitka spruce.

627. _____
1966. Pulping of home-grown timbers. Great Brit. Forest Prod. Res. Board Rep. 1965: 18-19.

628. Great Britain Forest Products Research Laboratory (Princes Risborough).
1934. Preliminary note on the timber of home-grown Sitka Spruce (*Picea sitchensis* Carr). Forestry 8: 126-130, illus.

629. _____
1941. Grading softwoods for strength; stress-grades for beams. Great Brit. Forest Prod. Res. Lab. Leafl. 19, 7 pp., illus.

630. _____
1945. A handbook of Empire timbers. Rev., 142 pp. London: H. M. Stationery Office.

631. _____
1953. Trials of timber for plywood manufacture. Small-scale tests on: consignment 750, Scots pine; consignment 763, Sitka spruce. Great Brit. Forest Prod. Res. Lab. Progr. Rep. 21, 11 pp.

Gives data on processing trials, gluing properties, and veneer quality.

632. _____
1953. Properties of thinnings of home-grown Sitka spruce (*Picea sitchensis*). Great Brit. Forest Prod. Res. Lab. Progr. Rep. 1--Consignment 761, 12 pp. plus 9 figs.

Gives data on the following: rate of growth as shown by ring width; density; wood structure; conversion and quality of converted timber; grading; strength properties; seasoning properties and suitable schedules; durability and preservative treatment; and working properties. The timber proved to be fast-grown, with low specific gravity. The soft early wood, broad in comparison with the late wood, tears when sawn or worked with cutting tools, giving a poor finish. The timber is unsuitable for joinery. There was no appreciable collapse in seasoning, but pressure during preservative treatment caused collapse.

633. _____
1953. Properties of thinning of home-grown Sitka spruce (*Picea sitchensis*). Great Brit. Forest Prod. Res. Lab. Progr. Rep. 2--Consignment 763, 15 pp., illus.

The 49-year-old wood was from Gravetye Forest, Sussex. It was fast grown for the first 25 years, and averaged 10 or more rings per inch in the outer half. The report compares wood properties with that grown under different conditions elsewhere. The soft early wood tore when sawn or worked with a cutting tool but was more satisfactory than that from Inverliever. There was a large percent of grade II material and 1.4 percent of grade I. There was no appreciable collapse in seasoning, but collapse occurred during preservative treatment under pressure. The parcel was superior to that from Inverliever except for larger knots.

634. _____
1956. Combined report on the properties of thinnings of home-grown Sitka spruce (*Picea sitchensis*). Great Brit. Forest Prod. Res. Lab., 11 pp. plus 8 figs.

Describes wood structure, conversion, grading, and strength tests of thinnings from several plantations. In general, the wood was grown too fast for many uses.

635. _____
1957. Properties of thinnings of home-grown Sitka spruce (*Picea sitchensis*). Great Brit. Forest Prod. Res. Lab. Progr. Rep. 7--Consignment 879, 55 pp. plus 1 fig.

This consignment is considered separately because the wood is from a plantation seriously underthinned and growth rate was slow. Similar in specific gravity to faster grown timber, it showed higher values in equivalent fiber stress at maximum load, modulus of elasticity and compression parallel to the grain, a considerably lower value for hardness, and a slightly lower one for impact bending strength. Differences in growth rate made no appreciable difference in wood quality.

636. _____
1957. A handbook of softwoods. Dep. Sci., Ind. Res., 73 pp. London: H. M. Stationery Office.

Describes Sitka spruce trees, wood seasoning, and uses, in Canada and Great Britain.

637. _____
1958. Report on the properties of four different provenance consignments of Sitka spruce. Great Brit. Forest Prod. Res. Lab., 20 pp., illus.

Five trees, 30 years old, grown in Radnorshire were tested from each of four provenances: (1) Queen Charlotte Islands, (2) Mt. Olympus, Wash., (3) Siuslaw, Oreg., and (4) Siskiyou, Calif. Timber from (1) had the highest density and highest quality; differences in density between trees from the other three sources were not significant. (3) was less dense than (2) or (4). Trees from (3) were most subject to drought-crack but there was little difference between provenances in seasoning collapse. It is concluded that seed from northern provenances, especially that from (1), is preferable in timber quality.

638. _____
1967. Home-grown timbers - Sitka and Norway spruce. Great Brit. Forest Prod. Res. Board Rep. 1967: 5-6.

639. Great Britain Forestry Commission.
1930. Forestry commission yield tables for Scots pine and other conifers. 24 pp. London: H. M. Stationery Office.

Contains yield tables and height curves for Scots pine, European and Japanese larch, Norway and Sitka spruce, and Douglas-fir.

640. _____
1937. Spring frosts. Great Brit. Forest. Comm. Bull. 18, 131 pp., illus.

1946. The thinning of plantations. Great Brit. Forest. Comm. Forest Oper. Ser. 1, 40 pp.

642. _____
1948. Broom as nurse to Sitka spruce. *In* Report on forest research for the year ended March 1947. Great Brit. Forest. Comm., p. 38. London: H. M. Stationery Office.

Reports striking results of using broom, *Cytisus scoparius*, on difficult moorland sites. Trees with broom nurses were growing well and fast, whereas those without remained in check or grew very slowly. A similar effect has been observed with Scots pine as a nurse for Sitka spruce, but this is slower in developing.

643. _____
1958. Forestry practice; a summary of methods of establishing forest nurseries and plantations with advice on other forestry questions for owners, agents, and foresters. Great Brit. Forest Res. Forest. Comm. Rep. 14, 93 pp.

644. _____
1967. Forty-seventh annual report of the Forestry Commissioners for the year ended Sept. 30, 1966. Great Brit. Forest. Comm., 75 pp. plus 8 plates.

Lists source and amount of Sitka spruce seed imported and number of nursery plants sold to the trade, forest year 1966. Earlier reports give similar information.

645. _____
1967. Vegetative propagation. *In* Report on forest research for the year ended March 1967. Great Brit. Forest. Comm., pp. 92-93. London: H. M. Stationery Office.

646. _____
1967. Normal yield tables for Sitka spruce, yield classes 80 and 60 and Norway spruce yield class 80. Suppl. 1 to Forest Management tables booklet 16. Great Brit. Forest. Comm. (London).

647. _____
1967. Fomes annosus: a fungus causing butt rot, root rot and death of conifers. Great Brit. Forest. Comm. Leafl. 5, 11 pp., illus.

An account of the life history, method of infection, damage, and control of the fungus.

655. Gregory, R. A.
1956. The effect of clearcutting and soil disturbance on temperatures near the soil surface in southeast Alaska. USDA Forest Serv. Alaska Forest Res. Center Sta. Pap. 7, 22 pp., illus.

Measurements were made in the forest and in a clearcut area, on plots with undisturbed moss cover or where the organic and mineral soils had been mixed. Air and soil temperatures were considerably increased during late spring and summer as a result of timber cutting. Open soils warmed earlier and cooled earlier and more rapidly than forested soils, and the difference in soil temperature was still appreciable at a depth of 24 inches. No injury to Sitka spruce seedlings from excessive heat or frost was observed. Moss-covered seedbeds proved less desirable than disturbed soils for germination and early survival, but once seedling roots were established in the moist layers below the moss, chance of survival seemed good. Germination in disturbed soils was earlier and more concentrated. Germination in the forest was late and prolonged, and seedlings were still in the succulent stage at the end of the growing season.

656. _____
1957. 1956 cone crop report for Alaska tree species. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 35, 2 pp.

657. _____
1957. The accuracy of southeast Alaska site index estimates associated with variable numbers of height measurements. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 38, 2 pp.

Estimates of site index tended to be higher when Sitka spruce was used for height measurements than when western hemlock was used. The difference increased as site index increased. Below site index 100 the difference was negligible.

658. _____
1957. A comparison between leader growth of western conifers in Alaska and Vancouver Island. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 36, 2 pp.

The pattern of leader growth of western hemlock in southeast Alaska was similar to that recorded on Vancouver Island. Growth of Sitka spruce in Alaska stopped abruptly and earlier than that of western hemlock.

659. _____
1958. 1957 cone crop report for Alaska tree species. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 41, 2 pp.

1962. *Fomes annosus* (Fr.) Cke, and other root-rotting fungi in conifers on ex-hardwood sites. Forestry 35(2): 164-182, illus.

The development of root and butt rot caused by *F. annosus* in Sitka spruce and other conifer crops planted on ex-hardwood ground is slower than that in second-rotation conifer plantations. This is apparently due to competition from other fungi, notably *Armillaria mellea*. Excavations on ex-hardwood sites showed that *F. annosus* was present in conifer thinning stumps, and that transference of infection occurred, causing butt rot. The investigations confirmed the need for stump protection of all conifer crops planted on ex-hardwood sites. Short accounts are given of the activity of

A. mellea and *Polyporus schweinitzii*, the other two important root-rotting fungi on these sites. (From author's summary.)

665. _____
1967. Honey fungus. (Rev.) Great Brit. Forest. Comm. Leafl. 6, 10 pp., illus.

The honey fungus *Armillaria mellea* (Vahl. ex. Fr.) is a root parasite occurring commonly in British woods. Sitka spruce is very susceptible and in some stands almost every tree is attacked. The discussion includes descriptions and life history, detection methods, relative susceptibility of tree species, conditions favoring infection, and method of prevention.

666. Griffin, D. M.
1957. Fungal damage to roots of Sitka spruce seedlings in forest nurseries. *In* Report on forest research for the year ended March 1956. Great Brit. Forest. Comm., pp. 86-87. London: H. M. Stationery Office.

Investigation of root systems of Sitka spruce and other conifer seedlings in nurseries, before and after partial sterilization, indicate that damage by fungal pathogens is insufficient to account for the poor growth of seedlings in such nurseries. It seems likely that much of the beneficial effect of partial sterilization is due to changes in the amount and nature of available nitrogen.

667. _____
1958. Influence of pH on the incidence of damping-off. Trans. Brit. Mycol. Soc. 41(4): 483-490, illus.

Using *Beta vulgaris*, *Brassica campestris*, *Picea sitchensis*, and *Pinus contorta* as hosts and *Pythium ultimum* as parasite over a wide range of soil reactions, it was ascertained that the main factor in changes in incidence of damping-off with change in soil pH is the vigor of the host as expressed in growth rate during the susceptible period. Sitka spruce showed a strong negative correlation between incidence of disease and growth rate.

668. _____
1965. A study of damping-off, root damage and related phenomena in coniferous seedlings in British forest nurseries. *In* Experiments on nutrition problems in forest nurseries, Blanche Benzian [ed.]. Great Brit. Forest. Comm. Bull. 37, 1: 212-227, illus.

Pythium spp., especially *P. ultimum*, are the main agents of damping-off of Sitka spruce and other conifers in British forest nurseries. The disease is largely limited to established nurseries with alkaline or near-neutral soil reaction and can be controlled by partial soil sterilization.

669. Griffith, B. G.
1940. Effect of indolebutyric acid, indoleacetic, and alpha napthaleneacetic acid on rooting of cuttings of Douglas-fir and Sitka spruce. J. Forest. 38: 496-501, illus.

Dormant cuttings of Douglas-fir and Sitka spruce were successfully rooted (80 and 100 percent, respectively) by treating with either

indoleacetic or indolebutyric acid. Indolebutyric acid was more effective for stimulating root development than either indoleacetic or x-naphthalene acetic acid. The most effective dosage for Sitka spruce was 25.0 parts per million for 24-hour treatment periods. Treatment during the period February 20 to March 30 gave best results for both species.

1947. Postglacial forest succession, climate, and chronology in the Pacific Northwest. Amer. Phil. Soc. Trans. New ser. vol. 37, part 1, 126 pp., illus.

Presents a reconstruction and analysis of postglacial vegetation by pollen analysis of sedimentary columns taken from peat bogs. Present day observations indicate that Sitka spruce succeeds lodgepole pine, and in turn is succeeded by western hemlock on dunes and other sandy areas. Spruce also precedes hemlock on mature peat bogs, indicating that it can thrive under less favorable conditions. Plant succession has been interrupted from time to time by accelerated sand movement, which permitted lodgepole pines periodically to regain predominance. There is little indication on the coastal strip of a climate drier and warmer than the present at any time during the postglacial period. The principal cause of change in forest composition has been the periodic shifting of sand, disrupting succession toward the climax vegetation.

The author considers nutrient deficiencies to be the chief cause of susceptibility to beetle attack in Sitka spruce, and reports on the application of nitrogen at the rate of 300 kilograms per hectare with the Ruhr-Stickstoff forest roller in a poor stand on sand with a thick raw-humus layer. Soil improvement was rapid, and all but two very heavily infested trees recovered.

714. Hanson, H. C.
1951. Characteristics of some grassland, marsh, and other plant communities in western Alaska. Ecol. Monogr. 21(4): 317-375.

The study included Sitka spruce and white spruce stands. Compared with grassland stands, the soil was shallower, rocks were more numerous on or near the surface, the soil showed more podzolization, and the root systems were shallower.

1951. Forest entomology. *In* Report on forest research for the year ended March 1950. Great Brit. Forest. Comm., pp. 83-91. London: H. M. Stationery Office.

The study of aphid and other insect pests of Sitka spruce was continued. Although formerly the green spruce aphis, *Neomyzaphis abietina*, was considered to be the only important insect enemy of Sitka spruce, 12 species of insect are now known to cause serious damage to current-year foliage. Where several pests occur in the same area, it seems probable that the combined effects of their attack on young crops may prevent satisfactory growth, whereas in their absence the trees might continue to make satisfactory recovery from the effects of *Neomyzaphis* attack.

1965. Aerial seeding Sitka spruce and western hemlock on a cutover area in southeast Alaska. Northern Forest Exp. Sta. USDA Forest Serv. Res. Note NOR-10, 6 pp., illus.

Aerial seeding combined with natural seedfall resulted in adequate initial stocking of cutover areas. Approximately 60 live seeds were needed to produce each seedling surviving at the end of the first growing season.

729. _____
1966. Effects of slash burning on conifer regeneration in southeast Alaska. Northern Forest Exp. Sta. USDA Forest Serv. Res. Note NOR-18, 6 pp., illus.

Slash burning after clearcutting of an old-growth western hemlock-Sitka spruce stand favored the establishment of Sitka spruce. Fewer seedlings were established on the burned than on the unburned test area, but distribution was more uniform on the burn. The higher percentage of spruce after slash burning stemmed from improved initial spruce establishment. Once

established, seedling survival was not affected by burning. Ground cover on burned and unburned areas are compared.

730. _____
1966. A test of pruning Sitka spruce in Alaska. Northern Forest Exp. Sta. USDA Forest Serv. Res. Note NOR-13, 3 pp., illus.

Describes a test of dead-limb pruning of 38-year-old trees. Clear wood production over smooth branch cuts began 5 to 12 years after pruning. Decay associated with pruning was not a problem.

731. _____
1967. Natural reforestation on a mile-square clearcut in southeast Alaska. Pacific Northwest Forest & Range Exp. Sta. USDA Forest Serv. Res. Pap. PNW-52, 16 pp., illus.

Natural reforestation on a 700-acre logging unit of the Maybeso Experimental Forest, Prince of Wales Island, Alaska, was studied during 9 years beginning with clearcutting of the old-growth western hemlock-Sitka spruce stand. Production and dissemination of seed and establishment, development, and species composition of tree reproduction are discussed.

1960. Researches on the tannin content of the stembark of Sitka spruce and Douglas-fir. *In* Report on forest research for the year ended March 1959. Great Brit. Forest. Comm., pp. 115-116. London: H. M. Stationery Office.

Tannin content from bark of 27-year-old trees was not affected by the time harvested, but the red color of winter-harvested bark was more pronounced than from bark peeled during the growing season. After trees were cut, the amount of available tannin decreased with time. Therefore, bark should be peeled and dried within a month of felling.

736. _____
1961. Utilisation of tan barks: extraction of Sitka spruce bark. *In* Report on forest research for the year ended March 1960. Great Brit. Forest. Comm., pp. 107-108. London: H. M. Stationery Office.

Chemicals extracted from bark gave a usable product. N:N-dimethylformamide (IMF) and methanol both appear to be suitable agents for extracting spruce bark.

1954. Die tierischen und pflanzlichen Schädlinge unserer wichtigsten fremdländischen Holzarten. [Animal and plant pests of our most important exotic species.] Z. Pflanzenkrankh. 61(5): 255-269. [In German. English summary.]

Mainly a review of German literature. Sitka spruce is among the species discussed.

770. Henriksen, H. A.
1951. Et udhugningsforsog I Sitkagran. [A thinning experiment in Sitka spruce.] Forstl. Forsøgsv. Danmark 20(5): 403-418, illus. [In Danish.]

Thinning experiments were begun in 1935 on spruce planted on dunes between 1905 and 1912. Results for four thinning grades are tabulated, showing the number of stems, average height and diameter, basal area, and volume; the annual volume and basal area increment at 2-year intervals over 16 years; the 1951 volume per hectare by diameter classes; and average stem form in 1951. An attack by *Hylesinus micans* in 1949-51 appeared to be related to the degree of thinning--most severe in the heavily thinned plots and slight in the unthinned or lightly thinned plots.

1964. Epicormic branching of Sitka spruce. Pacific Northwest Forest & Range Exp. Sta. USDA Forest Serv. Res. Pap. PNW-18, 9 pp., illus.

Presents the effects of thinning and road right-of-way cutting on origin and development of epicormic branches on Sitka spruce. Light thinnings did not cause significant increases in growth of epicormic sprouts. Stems bordering right-of-way cuttings had an abundance of vigorous sprouts. Suggests that moderate to heavy thinning will stimulate epicormic branching, but such sprouting should have little influence upon quality of pulpwood and structural lumber. (Author's summary.)

1965. A Pleistocene phytogeographical sketch of the Pacific Northwest and Alaska, pp. 469-483, illus. *In* The quaternary of the United States. H. E. Wright, Jr., and David G. Frey [eds.]. Princeton, N. J.: Univ. Press.

Discusses the migrations of Sitka spruce and its associates from middle Wisconsin times to the present. Late-Glacial vegetation in the Pacific Northwest was mostly lodgepole pine park land, which along the moist coastal strip was succeeded by Sitka spruce and then Sitka spruce-western hemlock. Like the area south of glacier boundaries in Washington, unglaciated coastal refugia may have served as centers for plant invasion of deglaciated terrain. Unglaciated interior Alaska also was an extensive refugium for the major forest trees.

1961. Forest soils, long-term studies of the nutrient relations of forest crops and sites. *In* Report on forest research for the year ended March 1960. Great Brit. Forest. Comm., pp. 52-53. London: H. M. Stationery Office.

Tests of Sitka spruce needles from different parts of the same tree showed that nutrient status and needle weight are little affected by the position of the needles on the trees. Therefore, it should be possible to sample material from lower branches instead of from the top whorl (the normal sampling source) when access to the latter is difficult.

1967. Patterns of photosynthesis under natural environmental conditions. Ecology 48(2): 234-242, illus.

Net photosynthesis in six conifers including Sitka spruce was studied under various natural environmental conditions. Changes in the pattern of photosynthesis on clear days, especially the midday decrease, are apparently primarily controlled by changes in leaf water potential. In noble fir and Scots pine, water potential probably acts mainly through its influence on stomatal movement. In grand fir, Douglas-fir, hemlock, and Sitka spruce, however, some other mechanism, probably mesophyll resistance to CO_2 diffusion, seems to play a more important role. Both mechanisms probably operate concurrently in all species. Daily variations in leaf water potential seem to occur primarily in response to changes in atmospheric moisture or, more precisely, vapor pressure gradient from leaf to atmosphere. Variation in carbohydrate content, through its influence on solute concentration, may also influence leaf water potential. (From author's abstract.)

1950. The treatment of seed. *In* Report on forest research for the year ended March 1949. Great Brit. Forest. Comm., pp. 34-35. London: H. M. Stationery Office.

Tetrazolium bromide was selected as the most suitable staining compound tested both for the clarity of embryo staining and for nontoxicity. A standard viability test procedure has been developed, and a classification of stained embryos on the basis of the area stained and density of staining has been developed. Experiments over two seasons, using Sitka and Norway spruce, Scots pine, and European larch as test species, gave no evidence to support the practice of soaking seed before sowing, with the exception of Sitka spruce which showed an increase in final germination after soaking for 6 days (44 percent germination compared with 26 percent for unsoaked seed). Acid soaking had little effect on germination, and the final effect of acid treatment at the end of the first season was detrimental.

1962. Uporedna ispitivanja prirasta i produkcije biomase omorike, smrče i Sitke u rasadnickim uslovima. [Comparative studies on the increment and biomass production of *Picea omorika*, *P. abies*, and *P. sitchensis* in nursery conditions.] Sumarstvo 15(3/4): 147-158. [In Serbian.]

At 3 and 5 years of age, Sitka spruce seedlings showed greatest height, biomass, and root-collar diameter. The root-shoot relationship was shown to depend on age and species as well as on nursery treatment.

889. Johnson, F. A.
1955. Volume tables for Pacific Northwest trees. (A compilation.) U.S. Dep. Agr. Handbook 92, 6 pp. plus 122 tables.

Gives volume tables (cubic feet and board feet) for 18 species of Pacific Northwest conifers, including Sitka spruce.

890. Johnson, Herman M.
1943. Recovery of aero quality lumber from Alaska spruce logs. Timberman 44(7): 56-57, 64.

An enterprise known as the Alaska Spruce Log Program was set up to produce aero quality logs. The first Davis raft was delivered at Anacortes, Wash., in January 1943. Quality of the Alaskan logs is described and compared with those from Oregon. Alaskan logs averaged 1 to 9 inches smaller in diameter, had 5 percent greater defect, and off-center heart was present in one-third of the logs. The off-center condition was seldom present in Oregon logs.

1939. A descriptive list of natural and artificial interspecific hybrids in North American forest-tree genera. Can. J. Res. 17(12): 411-444.

Contains table showing interspecific crosses of *Picea sitchensis* Carr. with *P. canadensis* B.S.P., and *P. engelmanni* Engelm., with country, author, and date of report or of origin.

893. Johnson, Norman E.
1965. Distribution of Sitka spruce weevil eggs on leaders of open-grown Sitka spruce in southwest Washington. Weyerhaeuser Forest. Pap. 3, 11 pp., illus.

The Sitka spruce weevil (*Pissodes sitchensis* Hopk.) was found to start oviposition near the tip of the leader of Sitka spruce. As the season progressed, the weevil moved farther down the terminal, ovipositing with decreasing frequency until reaching the node. Most eggs were laid on the side of the terminal away from the afternoon sun. (From author's summary.)

894. _____
1965. A test of 12 insecticides for the control of the Sitka spruce weevil, *Pissodes sitchensis* Hopkins. J. Econ. Entomol. 58: 572-574.

Twelve insecticides are listed in increasing order of effectiveness, with respect to untreated control.

895. _____ and Zingg, John G.
1966. A test of several systemic insecticides for postoviposition control of the Sitka spruce weevil (*Pissodes sitchensis*). J. Econ. Entomol. 59: 765-766.

Oxydemetonmethyl, Bidrin, and probably Azodrin, would appear to be effective if applied in May. Concentration should be about 1 percent and the spruce leaders should be thoroughly wetted.

929. King, James E.
1958. Development of a stand of coniferous reproduction and interplanted Douglas-fir. Northwest Sci. 32(1): 1-8.

Stocking of an area with a sparse stand of young conifers, including Sitka spruce, was improved by interplanting with Douglas-fir, although animal damage and brush competition were serious obstacles to survival of planted trees. *Chermes cooleyii* had retarded or deformed 48 percent of the Sitka spruce in the natural stand.

930. Kinghorn, J. M.
1954. The influence of stand composition on the mortality of various conifers, caused by defoliation by the western hemlock looper on Vancouver Island, British Columbia. Forest. Chron. 30(4): 380-400.

In the first year after the collapse of the outbreak in 1946, tree mortality was light and only totally defoliated trees died. During the second and third years, mortality increased considerably, but by 1950 it had declined, surviving trees had recovered, and cumulative mortality up to 1950 was taken as the total suffered in the outbreak. Larger Sitka spruce trees suffered higher mortality for all defoliation classes than smaller trees, and mortality increased with percent of defoliation. Differences in mortality rates in crown, aspect, and altitudinal categories are explicable in terms of diameter or defoliation differences.

932. Klein, David R.
1965. Ecology of deer range in Alaska. Ecol. Monogr. 35(3): 259-284, illus.

In some areas on Coronation Island, new growth on spruce has been hedged by deer. This is most apparent adjacent to beaches at the heads of bays, although it also occurs where dwarfed spruce is available to deer at timberline. Spruce is rarely eaten by deer in southeast Alaska, and hedging of new growth has only been observed on small islands that have continued to support relatively high deer densities for many years.

933. Klein, J. A.
1951. Defect in the climax forests of southeast Alaska. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 9, 1 p.

Sitka spruce is less defective on better sites. The largest trees on any site are the most defective. Percent cull due to visible defect is tabulated by species, diameter class, and site.

934. Kloft, W., and Ehrhardt, P.
1959. Untersuchungen über Saugtätigkeit und Schadwirkung der Sitkafichtenlaus *Liosomaphis abietina* (Walk.) (*Neomyzaphis abietina* Walk.). [Studies on the sucking activity and damage caused by *Neomyzaphis abietina*.] Phytopath. Z. 35(4): 401-410, illus. [In German. English summary.]

N. abietina was bred and studied on 5- to 6-year Sitka spruce under long-day conditions in the laboratory. Attack is through the stomata; the insect pierces the parenchyma and sucks the central phloem, producing honeydew. Seven amino acids were found in the saliva of adults. The mean time between the piercing of the needle and the appearance of chlorotic flecks was 5 to 6 days for larvae, 8 to 10 for adults. The uptake of P^{32} in these chlorotic spots was considerably below that of the healthy green parts of the needles. Respiration was increased and photosynthesis decreased in the damaged needles.

1960. Beitrag zur Lachnidenfauna Mitteleuropas. [Notes on Central European lachnids.] Beitr. Entomol. 10(1/2): 161-168, illus. [In German. English summary.]

Includes a description of *Cinara pilicomis* on Sitka spruce with notes on its importance as a honeydew producer for bees and on ant trophobiosis.

936. _____, Ehrhardt, P., and Kunkel, H.
1961. Die Fichtenrohrenlaus *Elatobium abietinum* (Walk. 1849), ein endemisches Insekt der Rotfichte *Picea excelsa* in Europa. [*Neomyzaphis abietina* endemic on *P. abies* in Europe.] Waldhygiene 4(3/4): 121-125, illus. [In German.]

The aphid is endemic in Europe over the whole area of cultivation of Norway spruce, thought to be its natural host. Within the spruce's natural range, high densities (five to seven aphids per needle) have been found occasionally. Elsewhere, mass outbreaks have occurred only on exotics, particularly Sitka spruce, which is considered in danger from this pest over the whole area. In regions under Atlantic influence, mass outbreaks are further favored by anholocyclic hibernation.

950. _____
1966. Crown development in conifer stands in Scotland as influenced by initial spacing and subsequent thinning treatment. Forestry 39(1): 40-58, illus.

This paper deals with the different influences affecting the development of the crown percent in Norway spruce, Sitka spruce, and Douglas-fir stands and gives for these three species development curves of crown percent according to top height, thinning grade, and quality class. It shows the effect of different thinning grades on the crown surface (and crown volume) of the mean tree and the whole stand, together with the relationship between volume increment and crown surface (and volume). The contribution of the different canopy classes to the total increment of the stand is assessed. Finally the relevance which these findings might have on thinning techniques is considered. (Author's summary.)

951. Krause, Aurel.
1956. The Tlingit Indians. Results of a trip to the northwest coast of America and the Bering Straits. (Transl. Erna Gunther.) 310 pp., illus. Seattle: Univ. Wash. Press.

Describes spruce-hemlock forests of southeast Alaska and use of trees by the natives. Sitka spruce was used by the aboriginal Tlingit Indians for dugout canoes, hats, boxes; baskets were woven spruce root. The resin was used externally for treating sores, and heated seeds were used to cure toothache.

1961. Wurzelbildung junger Waldbäume auf Pseudogleyböden. [Root formation by young forest trees on pseudogley soils.] Forstwiss. Central. 80(11/12): 356-392. [In German.]

Sitka spruce was not useful as an admixture in Norway spruce stands to improve root penetration into lower layers of pseudogley soils.

954. Krygier, James T., and Ruth, Robert H.
1961. Effect of herbicides on salmonberry and on Sitka spruce and western hemlock seedlings. Weeds 9(3): 416-422, illus.

The following foliage sprays showed promise for control of salmonberry (*Rubus spectabilis*): the propylene glycol butyl ether (PGBE) esters of 2, 4, 5-TP and 2, 4, 5-T; the butoxy ethanol formulations of the same herbicides; and solubilized acid and solubilized poly-glycol esters of 2, 4, 5-T. Amitrol also was effective, especially added to 2, 4-D, with or without 2, 4, 5-T. Most selective was the PGBE ester of 2, 4, 5-T (2 and 4 pounds per 100 gallons of water with 5-percent kerosene), which did not damage Sitka spruce and western hemlock seedlings. Amine formulations were ineffective on *R. spectabilis*, and damaged hemlock. 2, 4-D, 2-(2, 4-DP) and 2, 3, 6-TBA were unsatisfactory. (From author's summary.)

955. Kuchler, A. W.
1964. Potential natural vegetation of the conterminous United States. Amer. Geogr. Soc. Spec. Pub. 36, 116 pp., illus., plus map.

Consists of a large map of the United States showing major vegetation types, together with a manual describing the vegetation units. Each unit is described and illustrated, and a bibliography is included. Sitka spruce is shown to be a component of the spruce-cedar-hemlock forest, located along the coasts of Washington and Oregon, and occasionally on western slopes of the Cascade Range.

956. Kukachka, B. Francis.
1960. Identification of coniferous woods. Tappi 43: 887-896, illus.

Instructions are given here in the sequential use of primary diagnostic features in the identification of coniferous woods including Sitka spruce. A data chart or marginally perforated cards may be used. Microscopic features are necessarily emphasized because of the greater accuracy obtainable through their use.

1959. Ergebnisse einiger Hybridierungsversuche zwischen *Picea sitchensis* (Bong.) Carr. und *Picea omorika* (Pancic) Purkyne. [Results of some trials of hybridization between *P. sitchensis* and *P. omorika*.] Silvae Genet. 8(5): 138-143, illus. [In German. English summary.]

Crosses, carried out in both directions, resulted in very few seeds, but these showed normal vitality. Hybrids from 1 year's trials exhibited hybrid vigor but those from other years did not. Hybrids were clearly intermediate between the parents in reaction to snow, to frost susceptibility, and to formation of leading shoot.

967. Larsen, C. Muhle.
1955. The seasonal variation in the natural rooting capacity of cuttings of Norway spruce and Sitka spruce. Z. Forstgenet. 4(3): 69-80, illus.

Reports on experiments made at the Royal Veterinary and Agricultural College's Arboretum, Horsholm, Denmark. Young twigs of the current year's growth were collected from lateral branches of Norway and Sitka spruce. Cuttings were taken in the period from the beginning of June to mid-April of the following year, propagated in cold frames, and examined the following autumn. Seasonal variations were noted in rooting ability, in the number and length of roots, and in the formation of new shoots. Seasonal variations are due largely to environmental growth conditions but also to length of cuttings. The only difficult period for rooting is at flushing, but the best time for taking cuttings under Danish conditions is early spring or the months of June and July, so that rooting can take place before winter.

1966. Dwarfmistletoe on Sitka spruce--a new host record. Plant Dis. Rep. 50(12): 921.

A Sitka spruce infected by dwarf mistletoe (*Arceuthobium campylopodum* f. *tsugensis* (Rosendahl) Gill) was found on Chichagof Island, Alaska. The host, a 10-foot sapling, was in the understory of a western hemlock stand. Dwarf mistletoe infections were present on almost every hemlock in the stand. The specimen was associated with witches'-broom form, typical of infections found on western hemlock.

993. _____
1952. The effect of pH and form of nitrogen on the growth of Sitka spruce seedlings. Forestry 25(1): 32-40, illus.

The effect of pH and form of nitrogen (NH4 and NO3) on the growth of Sitka spruce seedlings has been investigated on nutrient culture solutions over the range of pH 3-7. In both nitrogen series, the reaction for optimum growth of both shoot and root appears to lie between pH 4 and 5. Above and below this range there is a decrease in dry-weight production accompanied by increasingly abnormal root development. The form of nitrogen supplied appeared to have little effect on total growth at equivalent reactions, but from the root/shoot ratios it seems that nitrate nitrogen stimulates a greater relative root production than does ammonia nitrogen. (From author's summary.)

994. _____
1953. Growth and nutrition in heathland plantations. *In* Report on forest research for the year ended March 1952. Great Brit. Forest. Comm., pp. 117-119. London: H. M. Stationery Office.

Significant changes in growth and nutrition of planted trees occurred due to removal of heather (screefing) and the application of ground mineral phosphates.

995. _____
1954. The growth and mineral nutrition of spruce and pine in heathland plantations. Imp. Forest. Inst. (Univ. Oxford) Pap. 31, 109 pp., illus.

Poor growth of Sitka spruce in young plantations on upland heaths is attributed to nitrogen deficiences in the soil, aggravated by heather vegetation. Temporary improvement in growth may be brought about either by application of nitrogenous fertilizer or by removal of the heather vegetation. On some sites, manganese also appears to play an important role in growth increases.

996. _____
1955. The influence of artificial shading of the ground vegetation on the nutrition and growth of Sitka spruce (*Picea sitchensis* Carr.) in a heathland plantation. Forestry 28(1): 1-6, illus.

A marked stimulus has been obtained by shading the heather vegetation surrounding trees, by means of wooden laths. The increased growth was accompanied by significant increases in the concentration of nitrogen, ash, and manganese in the needles, indicating a substantial increase in the availability of these nutrients to the trees. A similar shading experiment on plots from which the heather (*Calluna vulgaris* Hull) had been previously removed by screefing produced only doubtful responses. Heather plants growing beneath the laths were found to contain appreciably lower concentrations of nutrients in the foliage than unshaded plants. While the response of the trees to shading of the ground vegetation is attributed largely to reduced competition by the heather for available nutrients in the soil, especially nitrogen, the mulching effect of the heather in maintaining satisfactory moisture conditions during dry periods is also involved. These findings offer an explanation for the improvement in the growth of spruce in mixture with nurse trees when the latter form a closed canopy and suppress the ground vegetation. (Author's summary.)

998. _____ and Weatherell, J.
1959. Coniferous litter amendments and the growth of Sitka spruce. Forestry 32(1): 7-13.

The growth of semichecked Sitka spruce on heathland has been stimulated to different degrees by the annual application (1956 and 1957) of litter of Scots pine, Corsican pine, lodgepole pine, Japanese larch, and Sitka spruce at rates corresponding to normal plantation conditions, following a heavier initial application (1955). Foliar analysis suggests that the response is at least partially attributable to the influence of the litters on the nitrogen nutrition of the spruce, and differences between litters appear determined by their nitrogen content. (From author's summary.)

999. Leyton, Leonard.
1958. The relationship between the growth and mineral nutrition of conifers, pp. 323-345, illus. *In* The physiology of forest trees, Kenneth V. Thimann, William B. Critchfield, and Martin H. Zimmermann [ed.]. New York: The Ronald Press Co.

Discusses the value of foliar analysis as a reliable method for diagnosis of nutritional status. Author concludes that with proper sampling, foliar analysis provides a reasonable guide to particular mineral deficiences limiting tree growth and to interpretation of field observations. Information on needle composition generally provides little guidance to the degree of response to a given increase in nutrient supply because of complex interaction of many factors. Sitka spruce was one of the experimental species.

Includes report on a provenance experiment with Sitka spruce planted in 1960-61. Seed sources ranged from latitude 46° to 60-1/2° N.

1011. _____ and Mitchell, A. F.
1966. Differences in phenology of Sitka spruce provenances. *In* Report on forest research for the year ended March 1965. Great Brit. Forest. Comm., pp. 173-184, illus. London: H. M. Stationery Office.

Small unreplicated demonstrations were planted in 1959 and 1960 with 12 provenances of Sitka spruce ranging from Alaska to Oregon, over a range of latitude from 60-1/2° to 43° N. These demonstrations were at four sites at latitudes from 51° N. to 57-1/2° N. They were assessed each year for date of flushing, and their height growth was measured at weekly intervals during the 1959-61 growing seasons. Date of flushing varied more between individual trees than between provenances; the latter differences were small, but the northern provenances tended to flush over a longer period than did the southern ones. The growth pattern also showed considerable variation within a provenance, but the most striking feature was the early cessation of growth on the provenances from northern Alaska, which stopped growing in midsummer when the southern provenances had completed only half of their annual height growth. Photoperiod or critical day length is suggested as the cause of growth cessation, as it was also found that the average date when the provenances stopped growing was related to latitude of the experimental site; the provenances continued to grow for the longest period at the most northerly site. (Author's summary.)

1958. Froets spiring hos Sitkagran og lerk. [Germination of Sitka spruce and larch.] Arsskr. Norske Skogplantesk 1957: 28-35. [In Norwegian.]

Stratification for 7, 15, 30, and 60 days considerably increased both germinative energy and capacity of Sitka spruce and Japanese larch, the effect increasing with duration of stratification.

1025. _____
1959. Spireforsøk i kjølerom. [Germination experiments in a refrigerator chamber.] Medd. Vestlandets Forstl. Forsoekssta. 33: 1-19. [In Norwegian. English summary.]

Scots pine, Norway and Sitka spruce, and Japanese larch seed were tested in a refrigerator kept at 2 to 4° C. In the first experiment, two lots of Sitka spruce seed were germinated in sand in a germinating bell. One lot, exposed to constant light, showed germination of 13.5 and 17.8 percent after

4 and 5 months, respectively, whereas the second lot, kept in complete darkness, showed no sign of germination, possibly because of heavy mold which cemented the seed and sand into an airtight cake. In another series of experiments, seeds of three provenances of pine, four each of Norway and Sitka spruce, and one of Japanese larch, were germinated in a simplified Jakobsen germinator, lit by two 40-watt lamps suspended 70 centimeters above the germination layer. Germination started in pine after 70 days, followed by Norway spruce (70 to 80 days), larch (100 to 120 days), and Sitka spruce (100 to 140 days). Most of the pine seed (81 to 92 percent) had germinated after 220 days; this point was not reached by the other species for 380 days. It is possible that with germination at these low temperatures there is some relationship between date of seed dispersal and speed and extent of germination.

1026. _____
1959. Stratifisering av Sitkagranfrø. [Stratification of Sitka spruce seed.] Arsskr. Norske Skogplantesk 1958: 47-50. [In Norwegian.]

Experiments were made in 1958 with seed from American sources collected in 1957 which germinated much more slowly than Norwegian seed. Seed was stratified for 15, 30, or 60 days either on filter paper in a petri dish or in a cone of filter paper resting in the neck of a widemouth bottle, and the number of seeds germinating in a Jakobsen germinator after 7, 15, and 21 days was determined. Results are tabulated. Seed stratified for 15 and 30 days germinated faster, and those stratified for 60 days slower, than untreated controls. The germination percent of some lots stratified 15 and 30 days was higher and for others lower than in the controls; stratification for 60 days considerably reduced germination compared with controls. A study of the nongerminating seed showed that few were either still living or empty; the percent of dead seed increased considerably with increasing length of stratification, and microscopic examination showed that the seed had been attacked by fungus.

1930. Observations on invasion of newly formed glacial moraines by trees. Ecology 11: 562-567, illus.

Presents observations made on the vegetational development on newly formed glacial moraines in southwestern Alaska. Pioneer species are *Picea sitchensis*, *Tsuga mertensiana*, *Alnus sinuata*, and *Populus tacamahaca*, in order of abundance.

1037. _____
1951. The concentration of certain chemical elements in the soils of Alaskan archaeological sites. Amer. J. Sci. 249: 925-928.

Determinations were made in the soils of two southeast Alaskan native village sites and in adjacent soils bearing natural forest growth. The food used by primitive man in Alaska was largely of animal origin and was relatively high in certain chemical elements. In time, the soil of the village sites was greatly enriched, with the result that there has been a 50-fold to 175-fold increase in phosphorus, a threefold to sevenfold increase in nitrogen, a fourfold to sixfold increase in potassium, and a twofold to twelvefold increase in calcium.

1038. _____
1963. History of Sitka spruce planted in 1805 at Unalaska Island by the Russians. USDA Forest Serv. Northern Forest Exp. Sta. 25 pp., illus.

The first attempt at tree planting in the Aleutian Islands was made in 1805, inspired by the Russian chamberlain, Rezanov. When last examined (1958) 10 trees were still standing, six alive and four dead. Live trees ranged in height from 24 to 28 feet. Seedlings were found up to 300 feet from the trees.

1039. Luxford, R. F.
1944. Strength of glued laminated Sitka spruce made up of rotary-cut veneers. USDA Forest Serv. Forest Prod. Lab. Rep. 1512, 13 pp.

1952. Trees, shrubs and flowers to know in British Columbia. 168 pp., illus. Toronto and Vancouver: J. M. Dent & Sons (Canada) Ltd.

1041. _____
1956. Trees, shrubs and flowers to know in Washington. 211 pp., illus. Toronto and Vancouver: J. M. Dent & Sons (Canada) Ltd.

1042. Macaulay Institute for Soil Research.
1957. Forest fertilizer trials. Macaulay Inst. Soil Res. Rep. 1956/57: 52.

Analysis of foliage collected in September 1956 from lodgepole pine and Sitka spruce on deep peat at the Lon Mor indicated a positive correlation between height growth and levels of N, K, and Mg in the foliage of both species in plots that had received P at the time of planting, suggesting that these elements were likely to limit growth in larger trees whose initial P requirements had been satisfied.

1043. _____
1959. Tree growth on deep peat. Macaulay Inst. Soil Res. Rep. 1957/58: 44-45.

Use of the pressure-membrane apparatus to investigate the tensions at which moisture is held in peat under trees suggests that although a reserve of available moisture still exists in the relatively dry peat under the largest trees, temporary moisture shortage may be experienced during a dry summer. An investigation has been started on the marked effect of plough ridge depth on the early growth of lodgepole pine and Sitka spruce on peat at Wauchope Forest.

1044. _____
1960. Forest fertilizer trials. Macaulay Inst. Soil Res. Rep. 1958/59: 15.

Analysis of foliage samples collected at the end of the second growing season from lodgepole pine and Sitka spruce in the N/K/Mg fertilizer trials on deep peat at the Lon Mor showed that the spruce, which grew well earlier as a result of repeated P dressings, was suffering from acute K deficiency. Needle K content increased in the plots with K, and needle N content was slightly increased by the N treatment. Diameter growth during the third growing season showed an increase in the plots with K.

1045. _____
1962. Forest soils: nutrient content of peat. Macaulay Inst. Soil Res. Rep. 1960/61: 14.

Twelve deep-peat sites in Scotland were surveyed and samples were analyzed. Results showed that K deficiency in trees occurs earliest where total K content of peat is lowest, and that, in general, responses to phosphate vary inversely with the total P content of the peat. Sitka spruce has shown good early growth only on sites with a total peat N content of more than 2 percent and a relatively high ash content. These results suggest that a chemical survey of newly acquired deep peat areas might eventually be used to estimate suitability for different tree species and the type and amounts of fertilizers required.

1961. The growth of Sitka spruce on deep peat in Northern Ireland. 1. The effect of fertilizers and other treatments on the growth of young trees. Res. & Exp. Rec. Min. Agr. (Belfast) 10(2): 151-162.

Describes a study of the effects of various treatments on the growth of young Sitka spruce trees on deep peat, with particular reference to the incidence of check. The addition of certain nitrogenous materials to young trees in check produced a temporary improvement in growth and color, but this improvement was not so persistent as that obtained by deepening the main drains and placing the excavated peat around the trees.

1054. McCulloch, Walter F.
1929. Natural regeneration of Sitka spruce on the Queen Charlotte Islands. Forest. Chron. 5(4): 21-23.

Describes a regeneration survey made on all lands cut over during the wartime spruce logging. At least 10 years had elapsed since logging, allowing ample time for early stocking changes, so that the reproduction was considered fairly indicative of the expected mature stand. There is generally good reproduction on the island and fair reproduction of Sitka spruce.

1055. MacDonald, A.
1967. Trial plantations established by the Forestry Commission on the island of Hoy, Orkney. Scot. Forest. 21(3): 163-172.

Sitka spruce, considered one of the best species for exposed sites, proved disappointing.

1056. MacDonald, J.
1928. Growth and yield of conifers in Great Britain. Great Brit. Forest. Comm. Bull. 10, 187 pp., illus.

1953. Thirty years' development of afforestation techniques on difficult ground types in southwest Scotland. Forestry 26(1): 14-21.

Norway and Sitka spruce are the first choice for species to plant on Molinia heath lands following adequate drainage and turnover of turf.

1058. _____
1956. Effect of introducing pine species among checked Sitka spruce on a dry Calluna-clad slope. Scot. Forest. 50: 83-86, illus., plus 1 plate.

Sitka spruce made better growth when planted in mixture with Scots pine than when planted in pure stands.

1059. _____
1963. Thinning to meet today's problems. Forestry 36(2): 165-171.

1060. _____
1967. Norway or Sitka spruce? Forestry 40(2): 129-138.

Norway is the more plastic spruce and can suffer thinner soils and much more drought, but neither spruce is a shallow rooter where soils are good and deep. Of the two, the litter of Sitka is less harmful to the soil. To date there is no evidence that height for height Norway is more stable under high wind pressures, but the belief that it is less sensitive to frost than Sitka is well established. Sitka is far superior to Norway for planting at high altitudes and in exposed places and on Molinia peatlands in Britain, which accounts for the vast preponderance of the American species used in the west and the north of the British Isles. Planting Norway where Sitka could grow well results in only some 75 percent as much volume production. Types of site which each spruce requires and also which each cannot take are considered in detail. (From author's summary.)

1061. _____ and MacDonald, Angus.
1952. The effect of interplanting with pine on the emergence of Sitka spruce from check on heather land. Scot. Forest. 6(3): 77-81, illus.

1065. _____
1933. The form of the stem in coniferous trees. Forestry 7(2): 121-129.

Discusses and tabulates form class, root swelling, and bark percentages for several coniferous species including Sitka spruce. Includes a table of bark percentage for Sitka spruce.

1066. _____
1952. The place of northwestern American conifers in British forestry. Sixth Brit. Commonwealth Forest. Conf., Can., 1952; item 7a Silviculture. Great Brit. Forest. Comm., 21 pp.

Western American conifers now account for 23 percent of all conifer plantations in Great Britain. Sitka spruce covers a larger area than any other conifer except Scots pine; Douglas-fir has been extensively used, and increasing use is being made of *Pinus contorta*, *Tsuga heterophylla*, *Abies grandis*, *A. nobilis*, and *Chamaecyparis lawsoniana*. The part played by these species in British forest economy is discussed. Tables are given of the areas occupied by various age classes of each species, and of recorded height growth and volume production at various ages on selected sample plots. Notes are given on the less important forest species. (From author's summary.)

1067. _____, Wood, R. F., Edward, M. V., and Aldhous, J. R.
1957. Exotic forest trees in Great Britain. Great Brit. Forest. Comm. Bull. 30, 167 pp., illus.

Sitka spruce is the most extensively planted exotic in Great Britain. The 1947-49 woodland census showed 167,000 acres, or 9 percent of the entire productive forest area. The species is discussed in detail, including country of origin and provenance, historical notes, extent of planting, climatic requirements, site requirements, establishment techniques (planting and direct seeding), thinning, growth and yield, damage, genetics, natural regeneration, timber, and potentialities in Britain.

1068. MacDonald, J. M.
1956. Thinning Sitka spruce. Scot. Forest. 10(1): 26-30, illus.

Suggests some of the considerations that may apply to the thinning of Sitka spruce plantations in regions of moderate growth. The importance of heavy crown thinning is stressed.

1069. MacDonald, J. Maxwell.
1952. Wind damage in middle-aged crops of Sitka spruce and its prevention. Scot. Forest. 6(3): 82-85.

Gale damage is a serious economic factor on the west coast of Scotland, and Sitka spruce grown in dense even-aged plantations is particularly vulnerable. Suggested counter measures are the development of irregular and mixed crops by crown thinning, strip or group planting, and the planting of very small groups widely spaced over considerable areas, relying on natural regeneration to fill the spaces between groups.

1953. Association of *Rhizina inflata* with group dying of Sitka spruce. Irish Forest. 10(2): 58-59.

Investigation of a typical case of "group dying" in a 30-year-old stand of Sitka spruce showed that roots of all affected trees were completely dead, resin flow was profuse from the base of the stems but there was no stem or butt rot, and the ground around the base of the trees was covered with fructifications of *R. inflata*, a saprophyte that occasionally becomes parasitic.

1080. _____ and Clear, T.
1955. A further note on group dying of Sitka spruce and *Rhizina inflata*. Irish Forest. 12(2): 58-63, illus.

Includes photographs of fructifications of *R. inflata*, enlarged lenticels, and copious resin flow on the stem of a dying tree, and a typical example of group dying.

1081. McKee, M., and Birch, T. C.
1941. Growth of spruce at Conical Hill: a mycorrhizal explanation. New Zealand J. Forest. 4: 311-313.

Of the spruce (*Picea abies* and *P. sitchensis*) planted in Conical Hill State Forest between 1903 and 1916, those in the interior of pure stands are small, undersized trees and yellowish in color, whereas those growing adjacent to pines in particular, and also near Douglas-fir and larch, show a marked increase in size and are a dark, healthy green color. Evidence suggests that the beneficial effects of these conifers is mycorrhizal. The mycorrhizal fungus *Boletus luteus* is prevalent beneath pine stands in this area.

1945. The preference shown by birds for different species of trees in plantations. Forestry 19: 97-112.

As a result of counts made in about 120 plots, it was found that birds of the thicket type have strong preferences for nesting in certain tree species. Sitka spruce is the most popular species found. The suggestion is made that small plots of Sitka and Norway spruces planted in suitable places in plantations of other species giving bad nest sites will increase the number of birds, and examples are given of plots of this nature found to contain 40 to 50 nests per acre per annum. (From author's summary).

1959. Growth and survival of a Sitka spruce plantation in coastal Oregon. USDA Forest Serv. Pacific Northwest Forest & Range Exp. Sta. Res. Note 178, 6 pp., illus.

A report on the first 8 years of height growth and survival of Sitka spruce. Total survival for the first eight growing seasons was 80.5 percent. The chief cause of early death was smothering by debris and soil movement, but from 1953 onward competition from vegetation caused most mortality. Planting larger stock to give further initial height advantage is recommended.

1092. _____ and Freed, Virgil H.
1962. Basal treatments for control of salmonberry. Weeds 10(3): 247-248.

Salmonberry (*Rubus spectabilis* Pursh.), a strong competitor of Sitka spruce seedlings, was basally treated in western Oregon during the dormant season and at bud bursting in April, using a 1:1 mixture 2,4-D and 2,4,5-T. January applications gave generally poorer results than those in March and

April. March and April applications produced 100-percent defoliation and kill for all treatments, with only erratic exceptions. Diesel oil alone gave effective control only in April. Sprays containing 2-1/2 percent active ingredients gave as good results as those containing 5 percent.

1093. _____ and Ruth, Robert H.
1962. Basal spraying of red alder. Weeds 10(4): 324-325.

Red alder saplings overtopping Sitka spruce and western hemlock regeneration were readily killed with a basal spray of 2,4-D and 2,4,5-T in diesel oil.

1950. Genetics. *In* Report on forest research for the year ended March 1949. Great Brit. Forest. Comm., pp. 26-29. London: H. M. Stationery Office.

Individuals of Sitka spruce which appear to be able to throw off attack by *Neomyzaphis abietina* have been found in several localities. These have leaves with blunt and shouldered apices and a heavy construction; the leaf section is flat and the twigs are quite glabrous. Individuals of this type can often be spotted in a plantation by their dense, compact crowns, dense and flattened leaf arrangement, and bluish leaf coloration, and where *Neomyzaphis* is prevalent, by a sharp contrast in the intensity of infestation. The possibility that these trees are of hybrid origin is being followed up. Some notes are given on methods of grafting.

1963. High-speed drying of western softwoods for exterior plywood. Forest. Prod. J. 13: 23-29, illus.

Describes an experimental veneer dryer. Douglas-fir 1/6-inch heartwood veneer was dried from 5- to 35-percent moisture content in 4.38 minutes at 300° F. and 3,000 feet per minute gas velocity, and in 0.95 minute at 550° and 9,000 feet per minute. Average surface temperatures of the veneer at 5-percent moisture content were 186° and 280°, respectively, and no loss of color, strength, or gluability occurred. Similar results were obtained for Douglas-fir sapwood, and for Sitka spruce, west coast hemlock, and west coast balsam fir.

1124. Minore, Don.
1966. Identification of rotten logs in the coastal forests of Oregon and Washington. USDA Forest Serv. Pacific Northwest Forest & Range Exp. Sta. 16 pp., illus.

Sitka spruce logs decay rather uniformly, and sound wood is rare when the outer portions are rotten and crumbly. An identification key is presented.

1132. Mooney, O. V.
1960. Some notes on shelterbelts in Irish coastal regions. Irish Forest. 17(2): 53-56.

Discusses choice of species, width, and spacing within and between rows. For peats, *Pinus contorta* is recommended, with *P. mugo* in mixtures only, and *Picea sitchensis* only for wider belts on better peats or moist soils.

1133. _____
1965. A background to silviculture in Irish forestry. Forestry 38(1): 8-19.

The writer traces the history of tree species and woodland in Ireland from early times down to the start of state forestry about 1906. He then considers the influence which the availability of land, the geology, the distribution of forest types, and the climate have had on silviculture since. He discusses the main species used, pure and in mixture, and notes that the type of ground available is the main limiting factor in the choice of species and that the tendency today is toward a very limited range of species in which *Picea sitchensis* and *Pinus contorta* have an important part to play. (Author's summary.)

1953. Soil faunal investigations. *In* Report on forest research for the year ended March 1952. Great Brit. Forest. Comm., pp. 123-126. London: H. M. Stationery Office.

Outlines the quantitative structure and vertical distribution of the fauna in natural heathland and cultivated heathland planted with Sitka spruce. The populations obtained from these habitats represent 570,000 and 835,000 organisms per square meter, respectively. In the natural heathland, this total is concentrated in the first 2-1/2 inches of the profile, whereas in the cultivated site, in addition to the litter fauna, there is a considerable percent in the raw-humus "sandwich" created in the cultivation process.

1157. Murray, J. S.
1954. Two diseases of spruce under investigation in Great Britain. Forestry 27(1): 54-62 plus 1 plate.

Descriptions are given of two apparently distinct diseases. One, termed "group dying," occurs mostly in Sitka spruce but sometimes in Norway spruce and is characterized by progressive death of the roots and a tendency for the trees to die in small groups in the stand. Trees between 20 and 30 years of age are usually attacked. The second disease is termed "top dying" and is confined to Norway spruce. (From author's summary.)

1953. Group dying of spruce in Eire. Irish Forest. 10(2): 55-56.

Presents notes from Ireland on several examples of a disease, already under investigation in Great Britain, characterized by death of the root system and thinning of the crown, reduction in height increment, and unusually heavy cone production before death.

1161. _____
1955. *Rhizina inflata* associated with group dying of conifers in Britain. FAO Plant Protect. Bull. 4(1): 6.

Describes group dying of Sitka spruce and other tree species in west Britain and Ireland. A survey has shown a general association with the mealtime fires lit by workmen. The usually saprophytic *Rhizina* fruits vigorously on the charcoal, and fruit bodies are common on the ground in the groups. The majority of cases have also followed the first thinning, when such fires are lit. Mycelia have been traced to dark necrotic spots in the cortical tissues of dead tree roots. The gradual death of the roots is followed by a thinning of foliage and a slowing down of increment.

1943. A contribution towards a clarification of the *Trametes serialis* complex. Can. J. Res. Rep. 21: 211-234 plus 4 plates.

The fungus frequently isolated from a destructive, brown cubical rot in Sitka spruce and Douglas-fir, and formerly referred to as *Trametes serialis*, Fries, has been connected with a fruit body collected on Sitka spruce in the Queen Charlotte Islands, B.C. By means of morphological, cultural, and interfertility studies it has been shown to be distinct from *Trametes serialis* and is described herewith under the name *Poria micropora* Overholts, n. sp. Similar studies of *Poria sequoiae* Bonar, *Polyporus palustris* Berk., and *Poria carbonicaa* Overholts, n. sp., all of which have been confused with *Trametes serialis* because of similarities between fruit bodies or cultures, have demonstrated the validity of each of the species and have provided criteria for their separation on the basis of cultural characters. (Author's summary.)

1217. Osmaston, F. C.
1955. Thoughts on yield tables. Forestry 28(2): 117-124.

Examines the recently published Forestry Commission Record, "Revised Yield Tables for Conifers in Great Britain," and shows how the standing volume, basal area, numbers of trees, and mean quartergirth vary with the mean top height, irrespective of age and quality class. By analogy with the Indian Forest Record, "Multiple Yield Tables for Deodar (*Cedrus deodara*)," he concludes that treatment does not materially affect this relationship. A modified yield table for Sitka spruce based on mean top height only is given. (From author's summary.)

1221. _____ and Madgwick, H. A. I.
1957. Afforestation and soil reaction. J. Soil Sci. 8(1): 141-149, illus.

Describes a study of the pH relationships between the soil, litter, and tree leaves at 10 experimental areas from 17 to 50 years after planting. At each of these areas a number of different tree species has been established, including Sitka spruce.

1222. Owen, T. H.
1954. Observations on the monthly litter-fall and nutrient content of Sitka spruce litter. Forestry 27(1): 7-15, illus.

The monthly needle-litter deposition in a 30-year-old Sitka spruce plantation was recorded over 2 years and the litter samples were analyzed. Seasonal variation was found both in the amount and in the nutrient content of the litter-fall. Most fell in late autumn and spring, least from June to September. The Ca content increased from May to November, while N and the other minerals decreased over the same period. Average total annual litter-fall was 1,832 pounds per acre; average nutrient contents, expressed as percent dry weight: Ca, 0.366; N, 1.085; K, 0.26; P, 0.24; and ash, 3.35. In comparison with results recorded in Europe and America for other conifers, the Ca content of the litter is low, but since the total amount of litter deposited annually is small, and the content of other minerals is relatively high, it is suggested that pure Sitka spruce plantations may not necessarily lead to soil deterioration. (From author's summary.)

1957. Effect of exposure to Gamma-rays on the hygroscopicity of Sitka spruce wood. Nature 180(4587): 651, illus.

Hygroscopicity (and possibly other physical properties) of the wood appears to be affected only by very heavy doses of radiation; at less than about 10^7 rad, the effect is negligible. In connection with insect control, doses not exceeding 60,000 rad and often considerably less have been mentioned. It is concluded that such low doses are unlikely to have any significant physical effect on the wood itself.

1236. Patric, J. H.
1966. Rainfall interception by mature coniferous forests of southeast Alaska. Soil & Water Conserv. 21(6): 229-231, illus.

Rainfall interception loss was measured in a mature stand of western hemlock-Sitka spruce. Interception loss of about 25 percent of the annual rainfall must be accounted for in the forest water budget of southeast Alaska.

1237. _____
1967. Frost depth in forest soils near Juneau, Alaska. Pacific Northwest Forest & Range Exp. Sta. USDA Forest Serv. Res. Note PNW-60, 7 pp., illus.

Describes frost penetration beneath a mature Sitka spruce-western hemlock forest, on clearcut areas, and on a logging road.

1238. Patscheke, G., and Kerner, G.
1963. Der gerbstoffgehalt von Sitkafichtenrinde. [The tannin content of Sitka spruce bark.] Soz. Forstwiss. (Berlin) 13(11): 328-330, illus. [In German.]

Analytical data are tabulated for two dominant and two suppressed stems to show differences in tannin content with height in the stem and with bark thickness. The mean content of single stems varied from 16.5 to 22.6 percent. The yield of dry substance from bark is estimated at 7 to 9 kilograms for the smallest second-class stem and 20 to 26 kilograms for the largest first-class stem. It is concluded that European-grown Sitka spruce constitutes a useful tannin source worth investigation by the leather industry.

In field experiments, spraying young spruce with solutions containing 1 percent active DDT or 0.2 percent active parathion, or dipping the plants (top and roots, or top only) in DDT, gave good control.

1259. Peterson, C. A., and Cowling, E. G.
1963. Resistance of extractive-free coniferous woods to decay by white-rot fungi. (Abstr.) Phytopathology 53(3): 351.

No significant decrease in resistance to decay by *Polyporus* (*Polystictus*) *versicolor* and *P. anceps* resulted from extraction of wafers of Sitka spruce heartwood with ether, acetone, a one-half mixture (by volume) of ethanol/C_6H_6 and water, or with each of these solvents, successively in order of increasing polarity. Water extraction increased decay resistance. Impregnation of water-extracted wafers with solutions of 1 percent urea, 1 percent glucose, or both, decreased resistance, suggesting that water extraction had removed readily available nutrient materials essential to decay.

1948. Seed-beds and the heat wave. Scot. Forest. 1(3/4): 30-31.

Seed sown in Argyll in the last week of May 1946 made normal growth until the beginning of August. About mid-August it was noted that seedlings were turning brown and then breaking off at the soil surface. It was concluded that the damage was due to heat; the crystalline particles of grit covering the beds, having been raised to a very high temperature, scorched the seedling stems. The severity of damage to species was in the following order: Japanese larch, Sitka spruce, Scots pine, Norway spruce, Douglas-fir.

1263. Phillips, E. W. J.
1941. The inclination of the fibrils in the cell wall and its relation to the compression strength of timber. Emp. Forest. J. 20: 74-78.

As part of an investigation into the relation between anatomical structure and the maximum crushing strength of British-grown Sitka spruce, the influence of the degree of inclination of the spirally arranged fibrils of the middle layer in the secondary tracheid wall was examined. A satisfactory method of determining the fibril angle from the slope of the ray pit apertures is described. The normal variation in fibril angle within the tree was determined and the causes of this are discussed.

1965. Two-stage windthrow in Sitka spruce. Quart. J. Forest. 59(4): 322-326, illus.

Investigation of brittle windthrow fractures following an easterly gale in a stand of Sitka spruce growing on a Devonshire hillside showed that the stems had broken off at compression failures induced by a westerly gale 2 years earlier, following the cutting of a roadway, which increased the exposure. The "first stage" damage had become protected by wound tissue and rapidly developed compression wood, giving rise to well-marked stem swellings which presumably saved some stems from second and final damage when the rest were broken. The term "compression swelling" is suggested for this defect. (Authors' summary.)

1967. Soil survey for forestry purposes in upland Wales. Welsh Soils Discuss. Group Rep., pp. 110-119.

Freely drained brown earths and ochreous brown earths are suitable for Sitka spruce. Alluvial soil and mineral gley appear better for Norway than for Sitka spruce. Sitka is more suitable than Norway on ironpan soils, transition soils between ochreous and ironpan, and shallow and deep peaty gley soils, these being too exposed for Norway spruce. Except for deep peats, Sitka is preferred for most land over 1,000-foot elevation.

1961. Sitka seedling diseases. Rothamsted [England] Exp. Sta. Rep. 1960: 127-128.

1298. _____ and Last, F. T.
1962. Sitka seedling diseases. Rothamsted (England) Exp. Sta. Rep. 1961: 119.

Soils from five Forestry Commission nurseries were analyzed by a modified dilution-plate method, and fungus populations were compared. The two groups of fungi most often isolated from diseased Sitka spruce seedlings were rarely isolated from soil. *Cylindrocarpon radicicola* was the fungus most frequently isolated at Kennington Old and Ringwood nurseries; next was a group of *Pythium* spp. (*P. ultimum, P. irregulare,* and two new species).

Describes experiments made at the Weyerhaeuser Forestry Research Center to investigate the selectivity of weedkillers. Results are tabulated, giving comparative effects of different preparations on several tree and brush species including Sitka spruce.

1311. _____ and Johnson, Norman E.
1965. The absorption and translocation of the systemic insecticide Schradan in Sitka spruce and grand fir. Weyerhaeuser Timber Co. Weyerhaeuser Forest. Pap. 5, 9 pp., illus.

Schradan tagged with P^{32} was tested on seedlings grown in nutrient solutions in a controlled-environment chamber. Sixty parts per million Schradan in the nutrient solution was absorbed in greatest amounts in the current foliage after 16 days (3.5 parts per million in spruce) with old foliage, bark, and wood in decreasing order. Schradan applied to terminal buds was shown by autoradiographs to be absorbed and translocated down the main stem and into lateral branches.

1952. Strawberry mark in Sitka spruce lumber. *In* Selected government research reports, vol. 8, pp. 1-2, illus. London: H. M. Stationery Office.

Strawberry mark, a defect of Sitka spruce timber, is a reddish-brown patch, up to 1 by 1-1/2 inches in size, running radially through the wood. It is due to abnormal deposits of resin in the ray cells and does not always affect the wood structure, although in some cases the rays are greatly enlarged, thus reducing the strength of the wood. There may also be a slight deviation in grain.

1951. Physico-chemical properties of forest soils. Imp. Forest. Inst. Rep. (Oxford) 1949/50: 9.

Chemical analysis of moorland soils from Allerston Forest, Yorkshire, has demonstrated a high concentration of nutrients in the surface peat, where Ca, P, and K contents are respectively 10, five, and two times as great as in the subsoil of lower calcareous grit. The leached layer is very deficient in nutrients. The nutrient content of the litter formed by Sitka spruce planted on this soil is much higher where the trees are growing well than where growth is poor--the figures for Ca were respectively 9 milligrams per gram litter and 2 milligrams per gram litter.

1961. Folgeschaden des extremen Sommers 1959 in den Wäldern der Länder Schleswig-Holstein und Hamburg. [Damage resulting from the extreme summer of 1959 in the forests of the Schleswig-Holstein and Hamburg regions.] Forstarchiv 32(4): 65-73, illus. [In German.]

First losses in 1959 were in new plantations, but by July mature plantations and pole crops had suffered serious loss. In spring 1960 serious damage was visible in mature stands of Norway and Sitka spruce, and in the southeast of the region, in beech also. Heavy salvage fellings were necessary in places. The greatest losses occurred on mineral soil of high organic content where the water table had sunk sharply, and on dune sand, where damage on stand margins was considerable, particularly near

the coast. Increased numbers of insect pests were observed in 1960. The causes of the damage were complex, depending much more on soil condition, site, and stand situation than on absolute temperature and amount of rainfall.

1959. The effect of night temperature on tracheid size and wood density in conifers. Int. Ass. Wood Anat. News Bull. 2: 4.

Consists of an abstract of a paper prepared for the International Botanical Congress, Montreal. In seedlings of Douglas-fir, *Sequoia sempervirens*, and Sitka spruce grown under a range of different day and night temperatures, in a controlled environment, wood density and cell-wall thickness increased as temperature increased, but showed no consistent relation with day temperature or growth rate. Tracheid length increased as temperature increased, night or day. It is suggested that cell elongation is a relatively direct function of temperature, whereas cell-wall thickness is determined by net assimilation rate. A hypothesis based on observed changes in net assimilation rate with age is proposed to account for differences in density between so-called juvenile and adult wood.

1327. _____
1964. Studies on the physiology of xylem development. III: Effects of temperature, defoliation, and stem girdling on tracheid size in conifer seedlings. J. Inst. Wood Sci. 12, 3-11, illus.

It is concluded that tracheid length is influenced by temperature both directly and indirectly; but that increases in cell length associated with increasing light intensity are not explainable in terms of carbohydrate accumulation. The major determinants of lumen diameter are probably hormonal, but temperature can act directly within this framework. Cell-wall thickness is, to a large degree, influenced by carbohydrate availability but hormonal factors may also operate. (From author's summary.)

1957. Sambandet mellom daglengden og avslutningen av den arlige vekstperioden hos en del nåletreslag av interesse for vårt skogbruk. [The relation between day length and the end of the annual growth period in some conifers of interest to Norwegian Forestry.] Medd. Vestlandet. Forstl. Forsøkssta. 31: 62. [In Norwegian. English summary.]

To establish a 14-hour photoperiod during the summer, seeds were sown in a "shading box" (illustrated) from which light could be excluded; for comparison, seeds were sown in the open or in similar boxes either (1) uncovered or (2) covered with plexiglass. One-year seedlings of Sitka spruce of provenances from regions with a day length shorter than that in Norway during summer but longer than 14 hours, formed terminal buds earlier than controls. Frost-lifting affected the results, but otherwise the short-day treatment gave better wintering. Further experiments are planned.

1340. Robak, Håkon.
1950. Proveniensproblemet og vekstforedling av skogstraer. [The problem of provenance and tree breeding.] Tidsskr. Skogbruk. 58(9): 236-240. [In Norwegian.]

Concludes that although frost-resistant individuals of Sitka spruce may be found among material from the optimum zone of a southern provenance (State of Washington), these should not be used for tree breeding unless they are superior in vigor to plus trees of more northern provenance that are known to be frost resistant.

1959. Deterioration of logging residue on the British Columbia coast (western hemlock, amabilis fir, and Sitka spruce). Can. Forest. Prod. Lab. Tech. Note 11, 38 pp., illus.

During the first 3 years, decay losses amounted to over half the net volume: Sitka spruce was more, and amabilis fir less resistant than western hemlock. In western hemlock, decay was mainly of the brown cubical rot type, in Sitka spruce white rot was more prevalent, and in amabilis fir both types were about equal in importance. Deterioration of residue was affected by retention of bark and position of pieces relative to the ground, the occurrence of ambrosia-beetle infestations and of decays which originated in the standing tree and also by the length of material and the solar exposure. (From authors' summary.)

1956. Plantation survival and growth in two brush-threat areas in coastal Oregon. USDA Forest Serv. Pacific Northwest Forest & Range Exp. Sta. Res. Pap. 17, 14 pp., illus.

In spring 1949, conifer plantations were established on a 44-acre site of Douglas-fir and an 81-acre site of Sitka spruce-western hemlock that had been clearcut 1 to 2 years earlier. Examinations over a 5-year period showed that competition with red alder, salmonberry (*Rubus spectabilis*), and associated shrubs was severe; only 37 percent of the planted Douglas-fir and about 25 percent of the planted spruce and hemlock survived. Recommendations are broadcast burning and early planting with large stock, plus chemical brush control as needed.

1366. _____
1957. Ten-year history of an Oregon coastal plantation. USDA Forest Serv. Pacific Northwest Forest & Range Exp. Sta. Res. Pap. 21, 15 pp., illus.

In a comparison of 10-year survival and growth, Douglas-fir survived better and grew faster than either Sitka spruce or Port-Orford-cedar. Effects of competing vegetation, animal damage, and aspect are reported and discussed.

1367. _____
1958. Silvical characteristics of Sitka spruce. USDA Forest Serv. Pacific Northwest Forest & Range Exp. Sta. Silvical Ser. 8, 19 pp., illus.

Summarizes information on the silvics of Sitka spruce including its relationship to climate, soils, topography, and associated species. Includes a description of its life history from seedling stage to maturity.

1368. _____
1965. Silviculture of the coastal Sitka spruce-western hemlock type. Soc. Amer. Forest. Proc. 1964: 32-36, illus.

Briefly describes the silvics of Sitka spruce and western hemlock, describes the coastal spruce-hemlock forest type, and summarizes current silvicultural practices.

1369. _____
1967. Silvicultural effects of skyline crane and high-lead yarding. J. Forest. 65: 251-255, illus.

Skyline crane yarding 77,000 board feet of logs per acre from steep slopes in the Sitka spruce-western hemlock type in coastal Oregon exposed 6.4 percent of the mineral soil, compared with 15.8 percent by conventional high-lead yarding. Differences were not statistically significant. Skidtrails tended to be across the slope, in contrast to high-lead skidtrails, which were mostly up and down slope. Damage to established tree seedlings and lesser vegetation was about the same for the two systems. The skyline crane system requires much less road construction than conventional systems, reducing construction costs as well as soil disturbance and land area taken out of production.

1370. _____ and Berntsen, Carl M.
1955. A 4-year record of Sitka spruce and western hemlock seedfall on the Cascade Head Experimental Forest. USDA Forest Serv. Pacific Northwest Forest & Range Exp. Sta. Res. Pap. 12, 13 pp., illus.

Six clearcut areas, ranging from 15 to 81 acres, received adequate seed from surrounding stands throughout their area. Seedfall started in the last 10 days of October and tapered off gradually until April and May. Western hemlock produced more seed than Sitka spruce. Seedfall under dense 100-year spruce-hemlock stands was 15 times that on clearcut areas. Viability of seed from the two species averaged 55 percent.

1371. _____ and Berntsen, Carl M.
1956. Chemical basal treatment to control red alder. USDA Forest Serv. Pacific Northwest Forest & Range Exp. Sta. Res. Note 128, 6 pp., illus.

Red alder often overtops conifer seedlings, including Sitka spruce, on certain sites in the Oregon Coast Ranges. Foliage spraying from the air is recommended for control on large areas, but on smaller areas basal treatment is best--especially for trees over 15 feet tall. Three solutions of 2,4-D or 2,4,5-T were used, and each proved successful. Results are tabulated. Chemical control cost about as much as hand girdling but had the advantage of preventing root sprouting.

1372. _____ and Silen, Roy R.
1950. Suggestions for getting more forestry in the logging plan. USDA Forest Serv. Pacific Northwest Forest & Range Exp. Sta. Res. Note 72, 15 pp.

Presents and discusses techniques and principles for preparation of intensive forestry-logging plans for the Sitka spruce-western hemlock and Douglas-fir forest types.

1373. _____ and Yoder, Ray A.
1953. Reducing wind damage in the forests of the Oregon Coast Range. USDA Forest Serv. Pacific Northwest Forest & Range Exp. Sta. Res. Pap. 7, 30 pp., illus.

Storm winds causing windthrow came from the S.S.W. On the borders of clearcut areas, 93 percent of the wind damage occurred along the north and east boundaries, especially when these boundaries were on the leeward side of a ridge. No correlation was found between wind damage and size of cutting, but areas less than 2 acres sustained considerable loss. In stands

from which 16 to 24 percent of the volume had been removed in thinnings, losses from windthrow averaged 80 board feet per acre per year, while losses were heavy in other areas from which most of the dominant and codominant trees had been removed. Douglas-fir and Sitka spruce were more windfirm than western hemlock, and trees infected with root rot were particularly liable to windthrow. Windthrow is more severe on areas with a high watertable or very shallow soil. In virgin stands heaviest damage occurred on the lee side of ridges, beginning near the crest of the ridge and extending for some distance down the lee slope, and also on small ridges and level areas in the lee of higher ridges. Recommendations are made on cutting practices to reduce windthrow.

1374. Ruth, Robert Harvey.
1967. Differential effect of solar radiation on seedling establishment under a forest stand. 176 pp., illus. (Ph.D. thesis on file at Oreg. State Univ., Corvallis.)

Sitka spruce, western hemlock, and Douglas-fir seedlings all became established more readily on mineral soil under a forest canopy than did red alder. The ratio of viable seed sown in the spring to establish seedlings in the fall was 5.8 for the conifers compared with 46.7 for alder. Radiation had surprisingly little effect on seedling establishment but played an important role in first season growth. Spruce and hemlock growth increased with radiation up to an average daily radiation of about 150 Langleys, then decreased at higher radiation levels. The decrease was attributed to high soil moisture tension.

1947. Forestry in Denmark: A guide to our guests. Ed. 2, Danish Forest Soc., 114 pp., illus.

Includes a bibliography and who's who in forestry. Entirely in English. Sitka spruce was introduced in Denmark about 1875 and has been planted extensively of late bacause of its vigorous growth and frugality. *Fomes annosus*, however, does more harm to this species than to Norway spruce.

1377. Salt, G. A.
1963. Disease of Sitka spruce seedlings. Rothamsted [England] Exp. Sta. Rep. 1962: 122-123.

The number of seedlings obtained from 1,800 viable seeds per square yard differed greatly between nurseries, when all were sown under ideal conditions in March. Seed treatment with methoxyethyl mercury chloride reduced preemergence loss and increased numbers but had no effect on postemergence dampingoff, or on seedling height. Partial soil sterilization with formalin and chloropicrin controlled damping-off and substantially increased heights. Soil and seed treatments together produced the best results.

1378. _____
1964. Diseases of Sitka spruce seedlings in forest nurseries. Rothamsted [England] Exp. Sta. Rep. 1963: 114-116.

Dazomet (Mylone) proved as effective as formalin as a soil sterilant and has the practical advantage of being applied as a dry powder. Of fungi on root debris remaining in seedbeds from one year to the next, *Cylindrocarpon* sp. was most often isolated. Others were *Fusarium* sp. and *Pythium* sp. Although partial sterilants almost eliminated these three genera from debris, the material was colonized by other fungi rare or absent in isolations from untreated material. In tests of pathogenicity of pure cultures, all species of *Pythium* killed most seedlings before emergence. *Cylindrocarpon* and several species of *Fusarium*, *Phoma*, and *Botrytis* behaved as weak pathogens by decreasing emergence and causing some postemergence deaths.

1383. _____
1967. Pathology experiments on Sitka spruce seedlings. *In* Report on forest research for the year ended March 1966. Great Brit. Forest. Comm., pp. 104-108. London: H. M. Stationery Office.

The following fungi isolated from Sitka spruce seed were associated with germination failure and were reisolated consistently from dead seeds or seedlings: *Phizoctonia solani*, *Cylindrocarpon*, *Gliocladium roseum*, and unidentified psychrophilic fungus. Losses were greater when seed was incubated at 10° than at 20° or 5° C. and were decreased by treating seed with thiram dust. (From author's summary.)

1384. _____
1967. Pathology experiments on Sitka spruce seedlings. *In* Report on forest research for the year ended March 1967. Great Brit. Forest. Comm., pp. 141-146. London: H. M. Stationery Office.

An endophytic fungus in Sitka spruce seed greatly decreased the viability of dormant seed incubated for 4 weeks at 10° C. in sterilized quartz grit or in unsterilized nursery soil. Seed incubated at 15° C. and 20° C. germinated and escaped serious damage. Infection was prevented and viability maintained at 10° C. by treating seed with a 50-percent thiram dust. Seed from the same bulk as used in the laboratory, when sown in nursery seed beds in 1965 and 1966, mostly survived and germinated, but many seedlings became infected by species of *Pythium*, *Fusarium*, and *Cylindrocarpon* and died soon after they emerged. (Author's summary.)

1385. Sanzen-Baker, R. G., and Nimmo, M.
1941. Glazed frost 1940--damage to forest trees in England and Wales. Forestry 15: 37-54.

Damage to Sitka spruce was often severe but less than damage to larch or Douglas-fir. In both young and middle-aged plantations, dominant trees with large crowns overtopping their neighbors received worst damage, particularly in young stands of Sitka spruce and Douglas-fir.

1966. Oviposition preference of the black-headed budworm and host phenology. Northern Forest Exp. Sta. USDA Forest Serv. Res. Note NOR-16, 5 pp., illus.

Phenology of western hemlock and Sitka spruce shoot growth in relation to budworm hatch and development was studied on two aspects. Shoot growth of both tree species was greater and started earlier on south rather than north aspects. Budworm development followed the same pattern. Peak hatch occurred when hemlock buds began expansion and when spruce shoots had completed about 50 percent of their growth. In preference tests, budworms preferred hemlock for egg laying regardless of species on which they were

reared. Budworms may lay eggs on spruce during prolonged outbreaks when hemlock is severely defoliated, but it is likely that fewer of the larvae survive because the rapidly expanding spruce shoots provide less shelter.

1967. Soils of the Andept suborder in Alaska. Soil Sci. Proc. 31(5): 692-699, illus.

Describes the major well-drained soils of nonmountainous areas of Kodiak Island, the Aleutian Islands, the Alaska peninsula, and the southwestern Kenai Peninsula. The soils were formerly classified in the Ando group on the basis of similarities to that group as originally proposed in Japan. Field relationships and the shared characteristics of B horizons suggest that Andepts are readily converted to Orthods (Podzols) following occupation by Sitka spruce forest.

1447. Sinden, John A.
1964. An economic analysis to aid the marginal decision on rotation length. I. Presentation of the principle. Forestry 37(2): 161-178.

Discusses general principles, using a specific Sitka spruce stand type as an example.

1448. Skinner, Edgel C.
1959. Cubic volume tables for red alder and Sitka spruce. USDA Forest Serv. Pacific Northwest Forest & Range Exp. Sta. Res. Note 170, 4 pp.

Presents three tables supplementing or amending those previously published by the Station: Volume tables for permanent sample plots as recommended by the Puget Sound Research Center advisory committee for use in western Washington (28 tables (processed), 1953).

1485. _____
1953. Diffusion and penetration mechanism of liquids into wood. Pulp & Pap. Mag. Can. 54(2): 54-63, illus.

Measurements were made of water absorption by Sitka spruce heartwood blocks. Results show that the rate of natural penetration of water into wood in the fiber direction at different temperatures varies with the vapor pressure of the water and the inward diffusion of the vapor. Prepenetration of dry wood with NH^3 increases the rate of absorption almost to that obtained by evacuation, and the method may have possibilities as a rapid means of impregnating dry chips with cooking liquor during pulping.

1486. _____
1956. Dimensional stabilization of wood with carbowaxes. Forest Prod. J. 6: 201-204.

Specimens of Sitka spruce were soaked in water (controls), and in 25 percent (by weight) aqueous solutions of glycerine and of carbowaxes (polyethylene glycols) before ovendrying by successive stages. With carbowaxes of molecular weights between 200 and 600, almost complete stability was obtained; with higher molecular weights and with glycerine, stability was somewhat less. Weight increase due to deposition of carbowax averaged 50 percent. Carbowaxes can be easily leached, but it was possible to fix them with an equal weight of phenolic resin. The treatment, however, is likely to cause gluing and finishing difficulties.

1487. _____
1956. Thermal degradation of wood and cellulose. Ind. & Eng. Chem. 48(3): 413-417, illus.

1488. _____

1508. _____ and Johnston, D. D.
1961. The seasoning properties of home-grown Sitka spruce. J. Inst. Wood Sci. (London) 7: 28-33, illus.

The seasoning properties of British-grown Sitka spruce were examined with reference to the regions and sites from which it was obtained. It was shown that this material does not tend to split or check when drying, even at high temperatures and low humidities, but does tend to twist. A very severe drying schedule was finally recommended. Statistical analysis of the data failed to show differences of any significance between the final quality of the dried material from the six regions sampled, but they indicated a highly significant difference in seasoning properties between material from different sites and also from different trees. (From authors' summary.)

1955. The strength of timber struts. Great Brit. Forest Prod. Res. Spec. Rep. 9, 28 pp. plus 3 photos.

Gives the results of tests on struts of the type used in light construction. Species tested included Sitka spruce. The use of formulae in calculating strengths is discussed.

1525. _____ and Lavers, Gwendoline M.
1961. Variations in the strength and specific gravity of Sitka spruce grown in Great Britain. J. Inst. Wood Sci. 7: 15-27, illus.

Sitka spruce, widely used in afforestation by the Forestry Commission, is known to show considerable variation in quality, and the causes of this are not fully known. Variations in strength and specific gravity were

measured and related to the different geographical regions and site factors. Results indicate that the growth region has a small effect, but large variations occur between trees on the same site, although between-site and within-tree variations cannot be neglected. In addition, the relation between the "quality class" of the site and the properties is examined and the possibility of using tree girth in estimating timber properties is discussed. (From authors' summary.)

1526. Swanston, Douglas N.
1967. Debris avalanching in thin soils derived from bedrock. Pacific Northwest Forest & Range Exp. Sta. USDA Forest Serv. Res. Note PNW-64, 7 pp., illus.

Describes reconnaissance investigations of debris avalanches in shallow soils in southeast Alaska. In all cases described, slopes were steep and supported old-growth stands of Sitka spruce and western hemlock.

1951. Observations on litter fall and foliage nutrient content of some Pacific Northwest tree species. J. Forest. 49: 914-915.

Gives annual ovendry weight of litter fall, nutrient content of foliage (pounds per acre), and soil pH at three depths under several tree species including Sitka spruce.

1533. Taylor, R. F.
1929. The role of Sitka spruce in the development of second-growth in southeastern Alaska. J. Forest. 27: 532-534.

Mixed stands of Sitka spruce and western hemlock are more productive than pure stands of either species. A high percentage of spruce in the stand is desirable. Volume and quality of stands having different percentages of spruce by basal area are compared.

1534. _____
1930. Sitka spruce on the Tongass Forest looks south. Forest Worker 6(2): 14.

On the Tongass Forest most timber sales have been made on areas with southerly aspects, indicating that better quality timber occurred here. Of 37 areas on which yield studies were made, those with southerly aspects averaged 56.2 percent Sitka spruce with an average site index of 73.5 (50-year basis), whereas northeast slopes average 22.37 percent Sitka spruce with an average site index of 67.5.

1535. _____
1931. Two extremes of forest soils in southeastern Alaska. Forest Worker 7(6): 10-11.

Sample quadrats and belt transects showed that the optimum soil type for Sitka spruce reproduction consists of glacial silt and gravel lightly covered by a mold formed by the debris of pioneer plants, mostly willows, alders, and poplars.

1536. _____
1932. Plant indicators in southeastern Alaska. J. Forest. 30: 746.

In connection with a study of site prediction after the removal of virgin timber, all the important vegetation was listed on a number of plots in the hemlock-spruce type in southeastern Alaska. The lists seem to show that a definite correlation exists between the occurrence of certain of the plants noted and site index as indicated by total height at 100 years of age.

1537. _____
1933. Site prediction in virgin forests of southeastern Alaska. J. Forest. 31: 14-18.

Discusses the climax forest in southeastern Alaska, its relation to even-aged stands, and the effect of logging and other factors on the succession from one to the other. The possibility of applying ordinary yield table methods of site classification to these forests is also described.

1538. _____
1934. Yield of second-growth western hemlock-Sitka spruce stands in southeastern Alaska. U.S. Dep. Agr. Tech. Bull. 412, 30 pp., illus.

Normal yield tables for mixed even-aged stands in southeast Alaska.

1539. _____
1949. First records of growth for Alaska's young stands. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 1, 1 p.

Compares actual growth records from mixed even-aged Sitka spruce-western hemlock stands with growth predicted from normal yield tables (U.S. Dep. Agr. Tech. Bull. 412) and concludes that the yield tables are reliable.

1540. _____
1949. First results of thinning in Alaska. USDA Forest Serv. Alaska Forest Res. Center Tech. Note 3, 1 p.

Describes 20-year results of thinning in a mixed western hemlock-Sitka spruce stand at age 30 years in southeast Alaska.

1541. _____
1950. Alaska forest research problems and program. Alaska Sci. Conf. Proc. 1950: 11-19.

1542. _____
1950. Cubic form class volume tables for southeast Alaska. Alaska Forest Res. Center Tech. Note 6, 6 pp.

1543. _____ and Godman, R. M.
1950. Increment and mortality in southeast Alaska's second-growth stands. J. Forest. 48: 329-331.

Second-growth stands, consisting of about half Sitka spruce and half western hemlock by volume, produce double the average volume of the climax forests in about 80 years. Diameter growth of spruce is faster than that of hemlock, except in very young stands, and increases with the diameter of the tree. Diameter growth of spruce by site classes is usually greater than that of hemlock of the same site class. Within species, each site-class growth rate is at least double the next lower rate. Within diameter classes, the mortality percent of spruce is greater than that of hemlock, but the total mortality of hemlock exceeds that of spruce. Volume growth of spruce is greater than that of hemlock except in trees of very small diameters, and increases with the diameter of the tree. Site 1 and 2 spruce and site 1 hemlock should be selected as crop trees in stands selected for thinning and pruning. (Authors' summary.)

1544. Taylor, Ray F.
1930-31. Indicator vegetation on cutover lands of southeastern Alaska. Univ. Wash. Forest Club Quart. 9(1): 21-27.

Describes habitat conditions and vegetation species associated with Sitka spruce regeneration on cutover land.

1545. _____
1932. The successional trend and its relation to second-growth forests in southeastern Alaska. Ecology 13(4): 381-391.

Successional trends are described in the climax forests of southeastern Alaska. Plants characteristically found on four common habitats are listed, and it is shown that each group roughly indicates one of four stages in the successional trend.

1934. Available nitrogen as a factor influencing the occurrence of Sitka spruce and western hemlock seedlings in the forests of southeastern Alaska. 143 pp., illus. (Ph.D. thesis on file at Yale Univ.)

1549. _____
1935. Available nitrogen as a factor influencing the occurrence of Sitka spruce and western hemlock seedlings in the forests of southeastern Alaska. Ecology 16(4): 580-602, illus.

Nitrogen in available form was found to be an important factor in the occurrence of Sitka spruce. Up to a certain level, increased available nitrogen favored spruce establishment. Ammoniacal nitrogen accumulates in organic seedbeds where oxidation to nitrates cannot occur. Spruce seedlings are scarce on such seedbeds but western hemlock seedlings are abundant. The power of nitrification varies significantly with the overstory and seedbed. Differences are discussed. Also discussed are pH values of various seedbeds.

1959. *Polydrusus impar* (Gozis) (Col., Curculionidae) in Britain. Entomology 95(1136): 15.

The insect is reported from Sitka spruce in Rockingham Forest, Northants. It occurs commonly in the mountains of France and central Europe on *Picea abies* and *Pinus sylvestris* and has spread to conifer plantations in the Seine basin.

1557. _____ and Styles, J. H.
1958. *Otiorrhynchus niger* (F.) (Col., Curculionidae) in Britain. Entomology 94(1131): 183.

A record of the insect on Sitka spruce in Northamptonshire; the larvae attack the roots, and the adults feed on the leaves. It is believed to be the first British record of the insect, which is normally found in the mountainous regions of central and southern Europe.

1558. Thomsen, M.
1939. Angreb af *Tomicus chalcographus* paa Sitkagraner, Rødgraner, og Douglasgraner. [Attack of *T. chalcographus* on young Sitka spruce, Norway spruce, and Douglas-fir.] Forstl. Forsøgsv. Danmark 15: 199-208. [In Danish. English summary.]

In 1936, and especially in 1938, many young stands of Sitka and Norway spruce were heavily damaged by the insect. The primary cause was probably spring frost injury to the cambium, but there was evidence that most of the young trees did not succumb to the direct effect of the frost.

1559. Thulin, I. J.
1963. Forest tree improvement. New Zeal. Forest Serv. Forest Res. Inst. Rep. 1962: 36-39.

The importance of seed origin in Sitka spruce was demonstrated in a nursery trial of four provenances sown in a randomized trial. Mean heights of 2-year plants were 25 inches and 26.6 inches for California seed origins, 14.1 inches for an Oregon provenance, and 8.3 inches for a seed lot collected in one of the best stands of Sitka spruce in New Zealand. Height growth of the New Zealand origin ceased significantly earlier in the autumn than that of California provenances.

1587. _____
1963. Characteristics of Alaska woods. Forest Prod. Lab. Res. Pap. FPL-1, 64 pp., illus.

Contains information on the characteristics and utilization of 11 Alaskan woods including Sitka spruce. Mechanical characteristics, seasoning data, and preservative treatments of the species are discussed and tables summarizing strength properties, pulp processes and yields, and drying schedules are included.

1588. _____
1963. The identification of Douglas-fir wood. (Rev.) Forest Prod. Lab. Res. Note FPL-010, 2 pp.

Revises a note first published in 1923, briefly describing differences between the wood of Douglas-fir and of other softwoods used for similar purposes, including Sitka spruce. Color of heartwood is pale pinkish brown; split or dressed surfaces have a silky sheen; tangentially split or dressed surfaces have a dimpled appearance; slight exudation of resin is occasionally present; odor is not pronounced.

1589. _____
1964. Pulp yields for various processes and wood species. Forest Prod. Lab. Res. Note FPL-031, 2 pp. plus 4 tables.

Lists density, fiber length, and typical pulp yields, as obtained primarily by kraft and sulfite processes, from many softwood and hardwood species grown in the United States, including Sitka spruce.

1590. _____
1928. Growth in the spruce-hemlock type. Pacific Northwest Forest Exp. Sta. Forest Res. Note 1, 4 pp.

1591. _____
1948. Woody-plant seed manual. U.S. Dep. Agr. Misc. Pub. 654, 416 pp., illus.

Gives information on time of flowering, cone ripening, seed periodicity, time of collection, seed yields, purity, soundness, and cost of seed. Sitka spruce cones yield 8 to 20 ounces of seed per bushel. Average number of seed per pound is 210,000. Recommendations are given for seed germination tests. Average germinative capacity is 60 percent.

1592. _____
1950. The forests of Alaska. Alaska Reg., 18 pp., illus.

Contains a description of Alaska's forests and of Sitka spruce which comprises 21 percent of the coastal forest type.

1593. _____
1953. Volume tables for permanent sample plots as recommended by the Puget Sound Research Center Advisory Committee for use in western Washington. Pacific Northwest Forest & Range Exp. Sta., 2 pp. plus 28 tables.

1612. _____
1959. Evidence of photoperiodic ecotypes in trees. Ecol. Monogr. 29: 91-111, illus.

The hypothesis of photoperiodic ecotypes was tested with 38 tree species (including Sitka spruce) of 19 genera and 81 seed sources from various latitudes in the northern hemisphere. The four greenhouse test conditions differed photoperiodically but specified the same amount of light from sun and fluorescent tubes. The farther north the seed source, the greater was the response to test conditions and the longer was the maximum "critical" day length that inhibited the seedlings. Interaction of seed source and photoperiod was analyzed and recorded by these responses: (1) Duration of elongation. Under certain day lengths, elongations of northern seedlings ceased while it continued in southern seedlings. (2) Amount of growth. (3) Lateral development. Numbers of side branches and buds were restricted in northern seedlings under short days. It is suggested that the photoperiodic ecotypes have evolved as an indirect mechanism in the adaption of trees to various seasonally changing climate factors. Thus, they are only approximately similar at different sites in each latitude.

1959. The water-conducting systems in conifers and their importance in the distribution of trunk-injected chemicals. Boyce Thompson Inst. Contr. 20(1): 27-38, illus.

The routes by which water is conducted upward in conifers were studied by injecting acid fuchsin near the base of young to middle-aged trees. Five different patterns of translocation were detected in the sapwood of the conifers examined. These, and the way they affect distribution of the injected materials, are described. Type A, the spiral ascent, turning right, is characteristic of the investigated species of *Picea*.

Sitka and oriental spruces of 35 or more years of age are susceptible to attack. The life history of the insect in Holland is described.

1632. Wade, Leslie Keith.
1965. Vegetation and history of the sphagnum bogs of the Tofino area, Vancouver Island. 125 pp., illus. (M.S. thesis on file at Univ. Brit. Columbia.)

Within the study area, pure Sitka spruce stands lie adjacent to the open ocean, occupying a narrow strip along the bank and along the surface of the coastal terrace. The strip of spruce is nowhere more than a few hundred feet wide, always fronting the open ocean. It is inferred that the distribution of Sitka spruce is in some manner controlled by the presence of the open ocean. Analysis of pollen profiles in a shallow (150-centimeter) bog is described. Spruce pollen was among the tree species found.

1951. The effect of partial sterilization on the occurrence of fungi in the soil. *In* Report on forest research for the year ended March 1950. Great Brit. Forest. Comm., pp. 107-110. London: H. M. Stationery Office.

1639. _____
1952. Effect of partial sterilization by steam or formalin on damping-off of Sitka spruce. Brit. Mycol. Soc. Trans. 35(4): 248-262, illus.

Three species of *Pythium* isolated from alkaline soil of an old established nursery at Ampthill were found to be parasitic to Sitka spruce seedlings. Symptoms varied from typical damping-off to a slow root-rot. Not all infected seedlings died, some surviving as stunted plants with partly diseased root system. Steam or formalin treatment markedly improved numbers and height of Sitka spruce seedlings in the first year after treatment and showed a moderate residual effect in the second year, but gave little improvement in the third year. (From author's summary.)

1953. Unexplained death of spruce in U. K. Australian Forest. 17(2): 49-54.

Nine sites have been examined on which Norway and Sitka spruce, 20 to 40 years old, are dying. The symptoms are discussed and comparisons made with the deaths of *Pinus* species which have been studied in Australia in recent years. It is suggested that the primary cause of mortality in both countries might lie in an upset of the balance between soil moisture and aeration and be accentuated by a restriction of the growing space for roots. (Author's summary.)

1644. Warrack, G. C.
1957. Natural regeneration in the Queen Charlotte Islands, p. 25. *In* Forest research review year ended March, 1957. Dep. Lands & Forests, Brit. Columbia Forest Serv.

With increased logging in the Queen Charlottes, natural regeneration can be expected to establish an adequate second crop of mixed hemlock-spruce-cedar, provided that the extent of contiguous clearcut areas is limited to 900 acres, preferably less; and encircling seed source within one-half mile is left for a period up to 10 years; and the amount of slash cover is reduced by 50 percent. Real efforts will have to be made to artificially regenerate within 3 years of clearcutting rich sites prone to early reclamation by alder, shrubs, and grasses. Protection of costly planted stock against heavy deer browsing may have to be contemplated in addition to the usual fire-protection measures. Burning has resulted in purer stands--mainly composed of Sitka spruce--but it is not a requisite to regeneration. (From author's summary.)

1953. The checking of forest trees by heather. Forestry 26(1): 37-40.

Experiments on podzolized heather moor at Allerston Forest have shown that a heather mulch applied around checked *Picea sitchensis*, *P. abies*, and *Chamaecyparis lawsoniana*, or more simply the elimination of living heather by surface hoeing, produces improved color and vigor of the trees. It has also been demonstrated that the addition of a nitrogenous fertilizer to checked Sitka spruce can, at least temporarily, alleviate the condition of check. (Author's summary.)

1652. _____
1957. The use of nurse species in the afforestation of upland heaths. Quart. J. Forest. 51(4): 298-304.

Some early observations on the effects of nurse crops on Sitka spruce in an experimental area on the upland heaths (of north Yorkshire) are recorded. It was found that the importance of the nurse crop was due to its capacity to reduce competition from heather, rather than to any sheltering effect. Spruce roots were found to spread under the nurse crop, especially where this was Japanese larch, when they root in the larch litter and surface soil, by then free from heather. Some problems of tending the crop so as to give the spruce room to grow without removing all the nurse species and permitting the return of the heather are explained, and various patterns for mixing the species less intimately are described. The early indications of these new experiments are given. (Author's summary.)

1963. Soil and cover conditions after Wyssen skyline and high-lead logging. Thirteenth Annu. Alaska Sci. Conf. Proc., pp. 88-90.

Soil disturbance was severe on 0.4 percent and mild on 2.6 percent of an area logged with the Swiss-developed Wyssen Skyline Crane. Slash accumulations were heavy on 7 percent of the logged area. Stocking with tree reproduction was 85 percent, with 1,200 to 1,500 seedlings per acre. Logging with a conventional high-lead system caused severe soil disturbance on 33.4 percent and mild disturbance on 15.1 percent of the area. Slash accumulations were heavy on 10.3 percent of the high-lead logged area. Stocking with tree reproduction was 35 percent with from 300 to 400 seedlings per acre. Species composition of both seedling stands was about 75 percent western hemlock and 25 percent Sitka spruce.

1959. Een orienterend onderzoek naar de oorzaken van groeistoornissen in de bosbeplantingen in de Noordoostpolder. [A preliminary study on the causes of growth disturbances in plantations on northeast polder.] Uitvoer. Versl. Bosbouwproefsta., Wageningen 4(2): 26. [In Dutch. English summary.]

Physical properties of soils, especially structure and water economy, seemed to have more effect on growth of oak, ash, Japanese larch, Sitka spruce, and alder than chemical properties had.

1670. Whitaker, J. D.
1954. The edge effect in nursery beds. J. Oxford Univ. Forest. Soc. 4(2): 22-24.

An edge effect in nursery seedbeds of Sitka spruce was investigated. The outer rows of seedlings tend to be larger and of better color than seedlings from the center of the bed, a difference usually attributed to diminished competition for moisture. As a result of the present investigation, it is concluded that the superior growth of such marginal seedlings can be interpreted in terms of an improved N nutrition. Conversely, the severe competition for N inside the bed reduces seedling growth there and, in the absence of any marked change in the Fe or Mn uptake by the plant, leads to corresponding accumulation of these elements in the tissues.

Describes plant succession on areas where the sand is eroded by wind to, or near, the water table. Vegetation develops into an impenetrable thicket with increasing dominance of *Pinus contorta* and *Picea sitchensis*. Eventually the shorter lived pine dies out leaving a forest of spruce.

1675. Will, G. M.
1962. The uptake of nutrients from sterilized forest-nursery soils. New Zeal. J. Agr. Res. 5(5/6): 425-432, illus.

Soil sterilization trials were carried out in seven nurseries in the North and South Islands to test the possibility of increasing productivity by this means. Even where soil pathogens were not a problem, seedling growth, including Sitka spruce, was improved. Chloropicrin proved more effective than formaldehyde. The greatest increases in growth and nutrient (N, P, and K) uptake occurred in pumice-soil nurseries. However, in these soils, the beneficial effect lasted for 1 year only--thereafter growth and nutrient uptake were reduced. (From author's summary.)

1676. Williamson, Richard L.
1965. Silvicultural and economic aspects of removal of scattered overmature trees from a well-stocked pole stand in the Sitka spruce-western hemlock type. (M.F. thesis on file at Oreg. State Univ., Corvallis.)

Financial analysis showed an economic advantage for immediate removal of a scattered old-growth Douglas-fir overstory from a well-stocked 38-year-old stand of Sitka spruce and western hemlock. Subsequent growth of the young stand was proportional to residual volume; decay in logging wounds had little effect on net growth.

1959. Silvicultural investigations in the forest: (A) South and central England and Wales: Improvement of checked plantations. *In* Report on forest research for the year ended March 1958. Great Brit. Forest. Comm., pp. 40-41. London: H. M. Stationery Office.

Three years after application of six hundredweight potassic superphosphate per acre, 20-year Sitka spruce is 5 to 6 feet high versus

controls still in check at 1-1/2 to 2 feet. Large-scale mechanical broadcasting of triple superphosphate at rates up to six hundredweight per acre has been carried out, to evaluate the practicability and economics of such treatment. Elimination of dense heather by spraying with 2, 4-D had relatively little effect on crop growth in the first season after treatment, but the effects of added phosphate were greater in such cleared areas.

1693. _____, Holmes, G. D., and Fraser, A. I.
1962. Silvicultural investigations in the forest: (A) South and central England and Wales: wind stability studies. *In* Report on forest research for the year ended March 1961. Great Brit. Forest. Comm., pp. 29-30. London: H. M. Stationery Office.

Pulling-over trials have been carried out on Sitka spruce, 33 years old, growing on peat up to 24 inches deep, above mineral soils of different characteristics. Drainage increased the depth of rooting and slightly increased tree stability. Most trees rooted to the full depth of the peat, and the degree of root penetration into the mineral soil had more influence on stability than the total depth of rooting. For a given height, trees of high basal area tended to be more stable than trees of lesser basal area.

1956. Decay following logging injury to western hemlock, Sitka spruce, and true firs. U.S. Dep. Agr. Tech. Bull. 1148, 34 pp., illus.

The entry and spread of decay following logging injury to residual trees in partially cut stands were studied in western Washington and Oregon. A total of 27 different fungi were identified. On Sitka spruce, *Fomes pinicola* caused 34 percent; *Stereum* spp., 15 percent; and *Lentinus kauffmanii*, 11 percent of infections. Decay rate was slower for spruce than for hemlock at the start, but faster once the decay was established.

1705. _____, Rhoads, Arthur S., and Isaac, Leo A.
1947. Decay losses following logging injury in partially cut stands of western hemlock and Sitka spruce. Timberman 48(10): 52, 54, 72, 74, 76, illus.

Approximately half of the reserve trees injured by logging became infected with wood-rotting fungi in a period varying from 5 to 32 years. The decay following logging injury amounted to 41 percent of the calculated gross increment since logging of the western hemlock trees studied and

43 percent of the growth of Sitka spruce. On all areas studied there was windfall loss and mortality from causes in addition to decay. Measures to reduce losses are discussed.

1706. Wright, Jonathan W.
1955. Species crossability in spruce in relation to distribution and taxonomy. Forest Sci. 1: 319-349.

The result of 6 years' artificial-pollination experiments with 70 interspecific combinations is described. Detailed range maps are given and the comparative morphology of 31 species is tabulated. From the range, and from genetic and morphological data, it is concluded that *Picea glauca*, *P. engelmannii*, *P. pungens*, and *P. sitchensis* have a common, relatively recent origin and are probably related to Old World species through *P. jezoensis* of Japan. Crossability barriers appear to have arisen mainly from genic differentiation following isolation. Introgression is observable in western North America and in eastern Europe now and has probably played a significant role in the past.

1956. The silvicultural importance of the Sitka spruce weevil (*Pissodes sitchensis*) in coastal Oregon and Washington. Soc. Amer. Forest. Proc. 1955: 64-67.

It appears that hemlock will eventually dominate Sitka spruce in Youngs River plantation, Oreg., because of damage to spruce from *Pissodes sitchensis*. Intensity of weevil attack increases farther from the coast, with stands in the coastal fog belt relatively unaffected.

1711. Wright, Kenneth H.
1960. Sitka-spruce weevil. U.S. Dep. Agr. Forest Pest Leafl. 47, 6 pp., illus.

Describes the life stages, habits, damage, and control measures. The Sitka-spruce weevil (*Pissodes sitchensis* Hopk.) is the most serious insect enemy of young Sitka spruce throughout the range of the host tree in Oregon, Washington, and British Columbia. Intensive search has failed to locate the insect in Alaska.

1712. Wright, T. W.
1959. Use of fertilizers in the afforestation of deep peat. J. Sci. Food Agr. 10(12): 645-650, illus.

Phosphorus is frequently the primary factor limiting tree growth on deep peat. Phosphate manuring combined with deep plowing results in successful establishment on all but the worst sites. Foliage analysis has recently proved successful in diagnosing P deficiency. Recent studies have shown that, as the trees mature, natural supplies of other nutrients, particularly K, may become exhausted. Tabulated results are given for Sitka spruce.

1713. Wu, Yeng-Tsu.
1964. Intra-increment lignin content of five western Canadian coniferous woods. 43 pp. (M.S. Forestry thesis on file at Univ. Brit. Columbia.)

Lignin contents of extracted free wood meals prepared from three adjacent rings of mature wood, sampled at breast height, were determined according to the micro-method of Johnson, Moore, and Zank. Lignin content of Sitka spruce differed significantly within portions of growth increment. No significant differences were found between growth rings, but a slight increase in lignin content with age was observed. Early wood was higher in lignin content than late wood. Lignin contents were in the decreasing order of: hemlock, cedar, Pacific silver fir, Douglas-fir, and Sitka spruce.

1724. Zach, Lawrence W.
1950. A northern climax, forest or muskeg? Ecology 31(2): 304-306.

In southeast Alaska, present logging operations are in subclimax stands which are often the pioneer or invasion forest types usually having a large proportion of Sitka spruce following glacial recession, river valley filling, landslides, windthrow, fire, and old cuttings. Older stands have progressed to an all-aged condition and are more defective and less valuable commercially. The author theorizes that these stands may be merely a later stage in a progressive succession to muskeg within the altitudinal and gradient limits of peat formation.

1954. Experiments in tree planting on peat. Great Brit. Forest. Comm. Bull. 22, 110 pp. plus 25 photos.

Summarizes the results of numerous experiments carried out in various parts of Great Britain over a number of years, which have dealt mainly with methods of establishing crops of trees on peat.

1731. _____
1957. A trial of compost in planting on peat. *In* Report on forest research for the year ended March 1956. Great Brit. Forest. Comm., pp. 139-142. London: H. M. Stationery Office.

1732. _____
1960. Afforestation of upland heaths. Great Brit. Forest. Comm. Bull. 32, 145 pp. plus 34 photos.

The upland heaths comprise heather-clad land among the hills along the east side of Scotland and northern England. They are distinct from the peat-covered lands farther west.

1733. _____ and Farquhar, J.
1956. Pruning of conifers by disbudding. *In* Report on forest research for the year ended March 1955. Great Brit. Forest. Comm., pp. 102-106, illus. London: H. M. Stationery Office.

The method has interesting possibilities for Scots and Corsican pines and possibly even for Norway and Sitka spruces. After 6 years, the reduction in height growth through disbudding is not severe, though there is a considerable loss in girth increment. Fast-growing Douglas-fir has proved unsuitable for disbudding.

1736. Ziller, W. G.
1954. Studies of western tree rusts. 1. A new cone rust on Sitka spruce. Can. J. Bot. 32: 432-439 plus 8 photos.

A new cone rust has been found damaging seed of Sitka spruce on the Queen Charlotte Islands and a new *Chrysomyxa* has been found on *Moneses* uniflora in the same area. Field observations, controlled inoculations, and similarity of markings on aeciospores and urediniospores have led to the conclusion that the cone rust is the aecial stage of an undescribed *Chrysomyxa*. The rust is described and has been named *C. monesis*. Surface sterilization of the spruce seed before export is recommended. (Author's summary.)

1737. _____
1957. Fungi of British Columbia deposited in the herbarium of the Forest Biology Laboratory, Victoria, B.C. Can. Dep. Agr. Forest Biol. Lab., 59 pp.

Contains a check list of fungi, showing host of each. Fungi are also listed by host. Sitka spruce is listed as host for 61 fungi.

1738. Ziller, Wolf G.
1965. Studies of western tree rusts. VI. The aecial host ranges of *Melampsora albertensis*, *M. medusae*, and *M. occidentalis*. Can. J. Bot. 43: 217-230.

Picea sitchensis seedlings inoculated with basidiospores of *Melampsora* spp. appeared to be highly resistant to infection. One percent of seedlings became infected in each case.

1740. Zitzewitz, H. von.
1964. Zur empfindlichkeit verschiedener Holzarten gegen einige chemische unkrautbekampfungsmittel. [The sensitivity of various tree species to certain herbicides.] Forst- und Holzwirtsch. 19(5): 87-90. [In German.]

Describes the effects of dalapon on Scots pine, Norway spruce, larch, and beech, and of simazine and gesaprim on Douglas-fir, Sitka spruce, larch, *Acer pseudoplatanus*, and beech, when these herbicides were used for grass control in plantations. All species tolerated dalapon well (apart from Scots pine, which needed special care), if sprayed outside the growing season and if strength of the spray was regulated according to the species and conditions. Trials confirmed that simazine is effective on broadleaved species but is rapidly inactivated by raw humus. Gesaprim appears to be unsuitable for this purpose.

1955. Eine Krebserkrankung der Sitka-Fichte (*Picea sitchensis* (Bong.) Carr.). [A canker disease of Sitka spruce.] Forstwiss. Centralbl. 74(9/10): 293-305, illus. [In German.]

Describes a canker disease of Sitka spruce found for the first time in Germany. The probable causal agent is *Nectria cucurbitula*. The disease is not considered important enough to require limiting the planting of Sitka spruce in Germany.

SUBJECT INDEX

COMMON AND SCIENTIFIC NAMES OF VEGETATION MENTIONED IN LITERATURE REFERENCES

Alaska-cedar	*Chamaecyparis nootkatensis* (D. Don) Spach
Ash	*Fraxinus* spp.
Balsam fir	*Abies balsamea* (L.) Mill.

The mission of the PACIFIC NORTHWEST FOREST AND RANGE EXPERIMENT STATION is to provide the knowledge, technology, and alternatives for present and future protection, management, and use of forest, range, and related environments.

Within this overall mission, the Station conducts and stimulates research to facilitate and to accelerate progress toward the following goals:

1. Providing safe and efficient technology for inventory, protection, and use of resources.
2. Development and evaluation of alternative methods and levels of resource management.
3. Achievement of optimum sustained resource productivity consistent with maintaining a high quality forest environment.

The area of research encompasses Oregon, Washington, Alaska, and, in some cases, California, Hawaii, the Western States, and the Nation. Results of the research will be made available promptly. Project headquarters are at:

College, Alaska	Portland, Oregon
Juneau, Alaska	Roseburg, Oregon
Bend, Oregon	Olympia, Washington
Corvallis, Oregon	Seattle, Washington
La Grande, Oregon	Wenatchee, Washington

The FOREST SERVICE of the U.S. Department of Agriculture is dedicated to the principle of multiple use management of the Nation's forest resources for sustained yields of wood, water, forage, wildlife, and recreation. Through forestry research, cooperation with the States and private forest owners, and management of the National Forests and National Grasslands, it strives — as directed by Congress — to provide increasingly greater service to a growing Nation.
